FUNDAMENTALS

Mechanics	#	Itisthebranchofphysicalsciencewhichdealswiththebehaviorofabodyatrest or motion under the action of external forces.	
		Mechanicsisdivided into statics and dynamics.	
Statics	#	It is the branch of engineering mechanics which deals with the study of bodies at rest under the action of external forces.	
Dynamics	#	It is the branch of engineering mechanics which deals with the studyof bodies in motion under the action of external forces.	
Kinematics	#	Itisthebranchofdynamicswhichdealswiththe motionofthebodieswithout considering the forces causing the motion.	
Kinetics	#	Itisthebranchofdynamicswhichdealswiththemotionofthebodies considering the forces causing the motion.	
Unit	#	Itisthe acceptedstandard whichis usedforcomparisonofaphysical quantity.	
		Thereare foursystemsofunits i.e. C.G.S,M.K.S,S.IandF.P.S.	
Fundamental unit	#	Theunits by which fundamental quantities are measured are called as fundamental units.	
Derivedunit	#	The units bywhich derived physical quantities are measured arecalled as <i>derived units</i> .	
Dimension	#	It is a formula by which a physical quantity is expressed in terms of fundamental quantities with suitable power.	
Scalar	#	Aquantitywhichisspecifiedbyitsmagnitudeiscalledas <i>Scalarquantity</i> . Example: mass, length, area, volume, time etc.	
Vector	#	A quantity which is specified by its magnitude and direction is called as <i>Vectorquantity</i> . Example: force, weight, velocity, displacement, acceleration, moment.	
Mass	#	Itisthetotalquantityofmattercontainedinabody. The S. Iunitofmassis kilogram (kg). It is constant at all places. In can't be zero.	
Weight	#	It is the force with which a body is attracted towards the centre of earth. The S.I unit of weight is Newton (N). It is different at different places. It is zero at the centre of earth.	
Length	#	Itis the lineardistancebetween two points. The S. Iunit of length is metre (m).	
Time	#	Itrefersto thesequenceofevents. The S. Iunit of time issecond (s).	
Particle	#	Aparticle is an object having mass but no size. It has negligible dimension.	
Body	#	Abodyconsistsof matters buthavingdefinitemass and volume.	
Rigidbody	#	Abodywhich doesn't deform under the action of forces is known as a rigid body.	
Deformable body	#	Abodywhich deformsunder theaction offorcesis knownas a deformable body.	
Elasticbody	#	Abodywhichcandeformundertheactionofexternalforcesandcomebacktoits original shape and size after the removal of forces is known as <i>elastic body</i> .	

FundamentalQuantities:

Fundamental quantities are the quantities, which cannot be expressed in terms of any other physical quantity.

Example: length, mass and time. There are seven fundamental quantities in S.I system. Their symbol and unit is mentioned below.

Quantity	<u>Unit</u>	Abbreviation
Mass	Kilogram	Kg
Length	Metre	M
Time	Second	S
Temperature	Kelvin	K
Electric current	Ampere	A
Luminousintensity	Candela	Cd
Amount of substance	Mole	mol

Derived Quantities:

Quantities that can be expressed in terms of fundamental quantities are called derived quantities.

Examples of some derived quantities:

Quantity	<u>Unit</u>	Abbreviation
Area	squaremetre	m^2
Volume	cubemetre	m^3
Velocity	metre/sec	m/s
Acceleration	metre/secsquare	m/s^2
Force	Newton	kg-m/sec ²
Work, energy&heat	Joule	N-m
Momentof inertia	kilogrammetre sqare	kg-m ²
Power	Watt	J/s

Systemsofunits:

Generallyweusefoursystems of units.

- ♣ Centimeter-gram-second(C.G.S)system: Inthissystem the units of fundamental quantities i.e.mass, length and time are expressed in gram, centimeter and second respectively.
- ♣ *Metre-kilogram-second(M.K.S)system:* Inthis system the units of fundamental quantities i.e. *mass,length* and *time* are expressed in *kilogram,meter* and *second* respectively.
- * Foot-pound-second(F.P.S)system: Inthissystem the units of fundamental quantities i.e. mass, length and time are expressed in pound, foot and second respectively.
- ♣ *International systems of units (S.I system):* This system consists of seven fundamental quantities. In this system the units of fundamental quantities i.e. mass, length and time are expressed in kilogram, meter and second respectively.

FORCE&MOMENTS

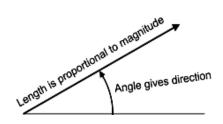

Force:

Forceissomethingwhichcanchangethestateofrestorstateofmotionofthebody. Itmayalso deform a body by changing its dimension. It is a vector quantity.

- * Mathematically, it is given by the product of mass of a body and the acceleration produced. i.e F=m.a
- ♣ The *unit of force* is Dyne(dyn)in C.G.S, Newton (N)in S. I and M.K.S. The gravitational unit of force is kilogram force (kgf) or gram force (gmf).
- $1N = 10^5 dyn, 1kgf = 9.81 N, 1gmf = 981 dyn.$
- * The *characteristics of force* are its magnitude, direction or line of action, point of application and nature of force.

GraphicalRepresentation of Force:

Any force can be represented in magnitude and direction by a straight line with an arrow head. The beginning of the line represents the point of application of the force. The arrowhead represents the direction of the force. The magnitude of the force is given by the length of the line drawn to scale.

Effects offorce:

- Itmaychangethestateof restor uniform motionofthe body.
- ♣ It maykeepthebodyinequilibrium.
- Itmayproduceinternalstressesin a body.

SystemofForces:

Typesof force	Definition	Figure
Collinear forces	If the lines of action of the forces acting on the body lie on a same line, then the forces are called as Collinear forces.	F ₁ F ₂ Like collinear forces F ₁ F ₂ unlike collinear forces
Concurrent forces	Ifthelinesofactionoftheforcesactingonthe bodypassesthroughacommonpoint,thenthe forces are called as concurrent forces.	F ₂ ← F ₃

Pull&Push	Pullistheforcewhichactsonthebodyatits front	
	to move it in the direction of force applied.	Push Padu Padu Pull
	Push is the force which acts on a body at its	Body Body
	back to move it in the opposite direction of	
	force applied.	

Actionℜ action	ActionistheactiveforceandReactionisthe reactive force. When a body is placed on a horizontal plane, the weight of the body (W) acts in vertically downward and a reaction force (R) acts in vertically upward direction. Where W iscalledastheactionofthebodyonplaneandR is called as the reaction of the plane on the body.	R
Tension &Compression	Tension is the pull which acts on the string, rope, rod or body. Compression is the push which acts on the string, rope, rod or body. A body is said to be in tension if it is subjectedtotwoequalandoppositepulls. A body is said to be in compression if it is subjected to two equal and opposite push.	Compressive Force Tension (T) body body
Trust	When a fixed surface is acted upon by compressiveforce,thatforceiscalledas thrust on that surface.	Thrust (W)

Principleoftransmissibility of aforce:

If the point of application of force actingon a bodyis shifted to anyother point of its line of action without changing its direction, then the effect of force remains unchanged and the equilibrium state remains unchanged. This principle is known as *Principle of Transmissibility* of force.

PrincipleofSuperpositionor Lawofsuperposition:

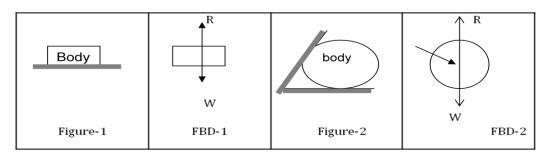

Thelawofsuperpositionisstatedas, "theactionofagivensystemofforcesonarigidbodyisnot changed by adding or subtracting another system of forces in equilibrium".

Freebodydiagram:

A bodyis said to befreebodyif it is isolated from all other connected bodies and supports.

Freebodydiagramofabodyisthediagram, whichis drawnbyshowing all the external forces and support reactions on the body and by removing the contact surfaces.

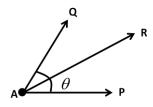

Examples offreebody diagram:

Resultantof a force:

*Resultant*ofaforcesystemisasingleforcewhichproducesthesameeffect as the force system produce.

If P and Q are the two forces acting on a particle at A, then their combined effectcanbereplacedbyasingleforceR. Where Riscalledastheresultant of P and Q. The forces P and Q are called as components of R.

Theresultant of the system of forces acting on a body can be determine by

- Analyticalmethod: byusingtrigonometric method (parallelogramlaw) and method of resolution.
- * *Graphicalmethod*: byusingtriangle and polygonlawof forces.

Composition of forces:

The process of determining the resultant force of a force system is called as Composition of forces.

Resolution of force:

The process of splitting up the given force into number of components is called as *Resolution of force*. Components are classified as perpendicular and non perpendicular components.

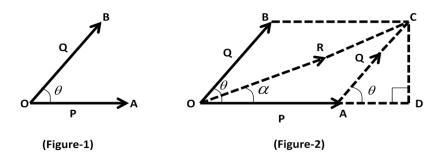

- * <u>Perpendicular components</u>— If the components of a force are given by two mutually perpendiculardirections, then the components are known as perpendicular components or resolve parts of the force.
- * <u>Nonperpendicular components</u>—If the components of a force are not given a long the two mutually perpendicular directions, then such components are known as *nonperpendicular components*.

Parallelogramlawofforces:

This law states that, "If two forces acting at a point are represented in magnitude and direction by the two adjacent sides of a parallelogram drawn from that point, their resultant can be represented in magnitude and direction by the diagonal of the parallelogram drawn through that point".

Determinationofresultantforce:

ConsidertwoforcesPandQ,actingatapoint'O' asshowninfigure-1. TheanglebetweenPandQ force isθ.

Letthetwo forcesPand Qare representedinmagnitudeanddirectionbythesidesOAandOBofa parallelogram OACB as shown in figure-2. In figure, resultant R is shown on the diagonal OC.

Draw CDperpendiculartoOA extended.From figure,OA= PandAC = $Q.\angle BOA = \angle CAD = \theta$

IntriangleOCD,
$$R = OC = \sqrt{OD^2 + CD^2} = \sqrt{(OA + AD)^2 + CD^2}$$
 -----(i)

Intriangle ADC,
$$\sin\theta = \frac{CD}{AC}$$
 $\Rightarrow CD = AC\sin\theta = Q\sin\theta$

$$\cos\theta = \frac{AD}{AC} \Rightarrow AD = AC\cos\theta = Q\cos\theta$$

Substituting the value of OA, AD and CD in equation-(i), we get:

LetRismakinganangle\approxwithP.IntriangleOCD,

angleOCD,
$$\tan \alpha = \frac{CD}{OD} \quad \frac{CD}{OA + AD}$$

$$\frac{CD}{OA + AD}$$

$$\frac{CD}{OA + AD}$$

If $Rismaking an angle \alpha with Q$, then we can write

$$\tan\alpha = \frac{P\sin\theta}{Q + P\cos\theta} - \dots$$
 (iv)

AnglebetweenPand Q	Resultant	Conclusion
θ = 0^{0}	R = P + Q	PandQarecollinearandactinginsamedirection.
$\theta = 180^{0}$	R =P- Q	PandQarecollinearandactinginoppositedirection.
$\theta = 90^{0}$	$R = \sqrt{P^2 + Q^2}$	PandQareperpendiculartoeach other.

PROBLEM

Que-1) Twoforces 50kN and 10kN are act at a point O. the included angle between them is 60° . Find the magnitude and direction of the resultant force.

Ans: Let forceP=50kN,forceQ=10kN,anglebetweenPandQ(θ)=60⁰ Resultant

of P and Q
$$= \sqrt{P^2 + Q^2 + 2PQ \cos \theta}$$

$$= \sqrt{50^2 + 10^2 + 2 \times 50 \times 10 \cos 60^0}$$

$$= 122.5 \text{ kN}$$
DirectionofR
$$\alpha = \tan^{-1}(\frac{P\sin \theta}{Q + P\cos \theta}) = \tan^{-1}(\frac{50\sin 60^0}{10 + 50\cos 60^0}) = 51.05^0 \quad (Ans)$$

Que-2) Findthemagnitude of two forcessuch that if theyactat right angles, their resultant is $\sqrt{10}$ kN and when theyactatan angle of 60° , their resultant is $\sqrt{13}$ kN.

Ans: Let P and Q are the two forces and their resultant is R.

Case-1:
$$\sqrt{10} = \sqrt{P^2 + Q^2} \Rightarrow P^2 + Q^2 = 10$$

Case-2: $\sqrt{13} = \sqrt{P^2 + Q^2 + 2PQ\cos 60^0} = \sqrt{P^2 + Q^2 + 2PQ} \times \frac{1}{2}$
 $\Rightarrow 13 = P^2 + Q^2 + PQ = 10 + PQ$
 $\Rightarrow PQ = 13 - 10 = 3$

Weknowthat; $(P+Q)^2 = P^2 + Q^2 + 2PQ$
 $\Rightarrow P+Q = \sqrt{P^2 + Q^2 + 2PQ} = \sqrt{10 + 2} \times 3 = \sqrt{16 = 4} - \dots$ (i)

Similarly $P-Q = \sqrt{P^2 + Q^2 - 2PQ} = \sqrt{10 - 2 \times 3} = \sqrt{4 = 2} - \dots$ (ii)

Solving equation-(i) and (ii) we get: $P=3 \text{ kN}$ and $Q=1 \text{ kN}$ (Ans)

Que-3) Thegreatestandleastresultantsoftwoforces are respectively 17kN and 3kN. Determine the angle between two forces when their resultant is $\sqrt{149}$.

Ans: LetP andQ arethetwo forcesandtheir resultantisR. AnglebetweenP&Qis θ .

Solvingequation-1 and 2 we get: P=10 kN and Q=7 kN

According to question;
$$\sqrt{149} = \sqrt{P^2 + Q^2 + 2PQ\cos\theta}$$

$$\Rightarrow 149 = P^2 + Q^2 + 2PQ\cos\theta$$

$$= 10^2 + 7^2 + 2 \times 10 \times 7 \cos\theta$$

$$= 100 + 49 + 140\cos\theta = 149 + 140\cos\theta$$

$$\Rightarrow \cos\theta = \frac{149 - 149}{140} = 0$$

$$\Rightarrow \theta = \cos^{-1}(0) = 90^0 \qquad (Ans)$$

Que-4) Twoforces are acting at an angle of 120° . The greater force is of 40 N and the resultant is acting at 90° to the smaller force. Find the magnitude of the smaller force.

Ans: LetPisthegreaterforce andQisthesmallerforceandtheirresultantisR. Angle between two forces (θ) = 120^{0} , P = 40 N Let α =angle betweenRand P= 120^{0} – 90^{0} = 30^{0} .

Weknowthat,
$$\tan \alpha = \frac{Q \sin \theta}{P + Q \cos \theta} = \frac{Q \sin 120}{40 + Q \cos 120} = \frac{Q \times 0.866}{40 + Q \times (-0.5)}$$

$$\Rightarrow \tan 30 = 0.58 = \frac{Q \times 0.866}{40 + Q \times (-0.5)} = \frac{0.866Q}{40 - 0.5Q}$$

$$\Rightarrow 40 - 0.5Q = \frac{0.866Q}{0.58} = 1.49Q$$

$$\Rightarrow 1.49Q + 0.5Q = 40 \Rightarrow 1.99Q = 40 \Rightarrow Q = 40/1.99 = 20.1N (Ans)$$

ASSIGNMENT

- **Que-1**)Find themagnitude of two equal forces acting at a point with an angle of 60^{0} between them, if the resultant is equal to $30 \sqrt{3}$ N. (Ans: 30 N)
- **Que-2**)Twoforces of magnitudes 3P and 2P respectivelyacting at a point have aresultant R. If the first force is doubled, the magnitude of resultant is doubled. Find the angle between the forces 3P and 2P.

 (Ans:120°)
- **Que-3**)In a concurrent force system, two forces are acting on a point at an angle 60° . The resultant forceis 120 N and one of the forces is 80kN. Determine the unknown force. (Ans: 57.98 kN)
- $\label{eq:Que-4} \textbf{Que-4}) Two forces of magnitude Pand Qareacting at a point. They are such that, if the direction of one is reversed, then the resultant turns through a right angle, show that P = Q.$
- **Que-5**)Two forces equal to 2F and F act on a particle. If the first be doubled and the second increasedby15N,thedirectionoftheresultantforceremainsunaltered.FindthevalueofF.

 (Ans:F=15 N)
- **Que-6**)Theresultantoftwoforces(P+Q)and(P-Q)is to $\sqrt{3P^2+Q^2}$. Show that the forces are inclined each other at an angle of 60^0 .
- **Que-7**) The resultant of two forces P and Q is a tright angles to P. Show that the angle between the forces is $constant = \frac{P}{Q}$.
- **Que-8**)Theresultantoftwoequalforcesactingatapoint also equals to P. Determine the angle between the two forces. (*Ans*: 120°)

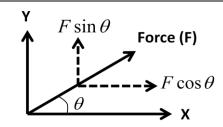

Methodof resolution:

- * Resolveall the forces acting on the bodyhorizontally and vertically.
- \clubsuit Findthesumofhorizontalcomponents(ΣH)andsumofverticalcomponents(ΣV).
- The magnitude of resultant of forces is given by: $R = \sqrt{(\sum H)^2 + (\sum V)^2}$
- * The direction of resultantis obtained at an angle θ with the horizontal form the following formula. $\tan \alpha = \frac{ZV}{ZH}$;

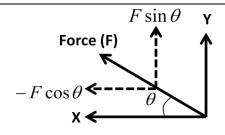

Where, α =angle made by the resultant with horizontal.

- If ΣV is positive, then $0^0 < \theta < 180^0$
- If $\sum V$ is negative, then $180^{\circ} < \theta < 360^{\circ}$
- If ΣH ispositive, then $0^{\circ} < \theta < 90^{\circ}$ and $270^{\circ} < \theta < 360^{\circ}$
- If ΣH is negative, then $90^{\circ} < \theta < 270^{\circ}$

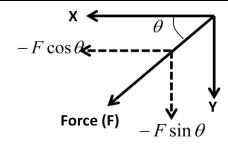

Resolution of forcein rectangular coordinates in different quadrants:

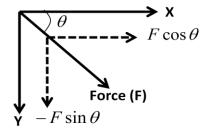

Force (F) in first quadrant

Force (F) in second quadrant

Force (F) in third quadrant

Force (F) in fourth quadrant

PROBLEM

 $\textbf{Que-1}) A block is resting on an inclined plane of 15^{0}. A force of 20 kN acts at 50^{0}$

withtheplane.

Determine:(a)thehorizontalandverticalcomponentsoftheforce (b) the componentsof force parallel and perpendicular to the plane.

Ans: Data given:

Force=20 kN,angleofinclined plane=15⁰, angleof force=50⁰.

- (a) Horizontalcomponentofforce= $20\cos 65^0$ =8.45kN Vertical component of force = $20\sin 65^0$ = 18.13 kN
- (b) Force parallel to the plane = $20 \cos 50^{0} = 12.85 \text{ kN}$ Forceperpendiculartoplane= $20 \sin 50^{0} = 15.32 \text{kN}$ (Ans)

150

Que-2)*Aparticleisacteduponbythreeforceswithmagnitudes*2kN, $2\sqrt{2}$

kNand1kN.Thefirst

forceisalonghorizontaldirection; secondmakes anangleof45⁰ with the horizontal and the third is along the vertical direction. Determine the resultant of the given forces.

 $(Ans:R=5kN, \theta=36.9^{\circ})$

Ans:Resolvingallforceshorizontallyandvertically &bytakingsumofhorizontal components and sum of vertical components we get:

$$\Sigma$$
H=2+2 $\sqrt{2}$ cos 45⁰=4 kN
 Σ V=1+2 $\sqrt{2}$ sin 45⁰=3 kN

$$R = \sqrt{(\sum H)^2 + (\sum V)^2} = \sqrt{(4)^2 + (3)^2}$$

= $\sqrt{25} = 5 \text{ kN}$

$$\tan \alpha = \frac{ZV}{3} = 0.75$$
 ZH
 $\Rightarrow \alpha = \tan(0.75) = 36.86$
 \therefore Themagnitude of resultant force is 5kN and it makes an angle of 36.86° with horizontal. (Ans)

- Fiveforces4, $\sqrt{3,5}$, $\sqrt{3}$ and 3kN respectively act at one of the angular points of a regular hexagon Que-3) towards other five angular points. Find the magnitude and direction of the resultant forces.
- Resolvingallforceshorizontallyandvertically&bytakingsumofhorizontalcomponents and Ans: sum of vertical components we get:

Que-4) Four horizontal wires are attached to a vertical telegraph and they exert the following pullsonthepost.(i)20kNtowardseast (ii)40 kNtowardsnorth-east (iii)30kNtowards north (iv) 50 kN towards south-west. Find the magnitude and direction of resultant pull.

Ans: Resolving all forces horizontally and vertically & bytaking sum of horizontal components and sum of vertical components we get:

$$\begin{array}{c} \Sigma \text{H}{=}20 \cos 0^0{+}40 \cos 45^0{+}30 \cos 90^0{-} \\ 50\cos 45^0{=}12.92 \text{ kN} \\ \Sigma \text{V}{=}20 \sin 0^0{+}40 \sin 45^0{+}30 \sin 90^0{+} \\ 50 \sin 45^0{=}93.63 \text{kN} \\ \\ R{=}\sqrt{(\underline{\Sigma}\text{H})^2{+}(\underline{\Sigma}\text{V})^2{=}\sqrt{(12.92)^2{+}(93.63)^2}} \\ =\sqrt{8933.50}{=}94.51 \text{kN} \\ \tan\alpha{=}^{ZV}{=}\frac{93.63}{ZH}{_{12.92}}{_{12.92}} \\ \Rightarrow \alpha{=}\tan(7.24) = 82.14 \\ \therefore \text{The magnitude of resultant force is } 94.51 \text{kN} \text{ and it makes an angle of } 82.14^0 \text{ with the horizontal.} \end{array}$$

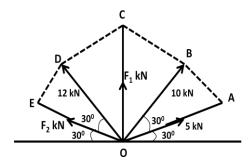

(Ans)

ASSIGNMENT

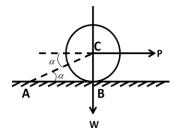

Que-1) Asmall block ofweight Q = 44.5 N isplaced on aninclined planewhichmakes an angle $\alpha = 30^{\circ}$ with the horizontal. Resolve the gravity force Q into two rectangular components Q₁ and Q₂ acting parallel and normal to the inclined plane respectively.

 $(Ans: Q_1=22.25 \text{ N}, Q_2=38.53 \text{ N})$

Que-2) Determine the magnitude of the unknown forces for the condition of equilibrium for the following force system. $(Ans:F_1=1.15kN,F_2=3.84kN)$

Que-3)A circular roller of weight W rests on a smooth horizontal plane and is kept in position by string AC as shown in the figure. The roller is pulled by a horizontal force P applied to its centre. Determine the reaction at B and the tension of the string. (Ans: P $tan\alpha + W$, P/ $cos\alpha$)

Principleofresolution of a Force:

It states that, "the algebraic sum of the resolved parts of a number of forces in a given direction is equal to the resolved part of their resultant in the same direction".

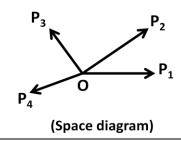

Trianglelawofforces:

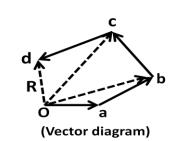

It states that, "if two forces acting simultaneously on a particle be represented in magnitude and direction by the two sides of a triangle taken in order, then their resultant may be represented in magnitude and direction by the third side of the triangle taken in opposite order".

Polygon law offorces:

It states that, "if a number of concurrent forces acting simultaneously on a particle be represented in magnitude and direction by the sides of a polygon taken in order, then their resultant may be represented in magnitude and direction by the closing side of the polygon taken in opposite order".

If P_1 , P_2 , P_3 and P_4 forces are acting simultaneously at a particle at O, be represented in magnitude and direction by the sides oa, ab, bc, cd of a polygon respectively; then their resultant is represented by the closing side 'do' of the polygon in opposite direction.

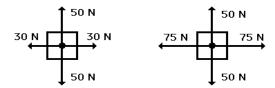

Equilibriumofa particle:

- Aparticleissaidtobein equilibriumwhenthe resultantofalltheforcesactingonitiszero or the net forces acting on the body is equal to zero.
- Whenalltheforcesthat actuponabodyarebalanced, then the body is said to be in a state of equilibrium.

The forces are considered as balanced if the rightward forces are balanced by the leftwardforcesandtheupwardforcesarebalancedbythedownwardforcesi.e.neteffectof forces on the body balancing each other.

These two objects are at equilibrium since the forces are balanced. However, the forces are not equal.

- ♣ Instatics abodyissaidtobeinequilibrium, when it come backto its original position after it is slightly displaced from its rest position.
- * The single forcewhich brings the force system to equilibrium is called as an *equilibriant*.
- * AnalyticalConditionsof equilibrium:

The algebraic sum of horizontal and vertical components of the forces acting on the body must be zero. (i.e. $\Sigma H = 0 \& \Sigma V = 0$).

Ifabodyisturningorrotating, then the algebraic sum of moments must be zero and the net couple acting on the body must be zero. (i.e. $\sum M = 0$).

• *Graphicalconditions of equilibrium*:

Theforceor vector diagram must be closed.

Lami'stheorem:

It states that, "if three coplanar concurrent forces acting at a point be in equilibrium, then each force is proportional to the sine of the angle between the other two forces".

Explanation: Letthreeforces P, Qand Rareacting at a point 'O'. Let α = angle between R and Q, β = angle between Q and P, γ = angle between R and P.

According to Lami's theorem: $\frac{P}{\sin \alpha} = \frac{Q}{\sin \beta} = \frac{R}{\sin \gamma}$

Proof:

Consider three coplanar concurrent forces P, Q and R acting at a point 'O' as shown in *figure-1*. Let α = angle between R and Q, β = angle between Q and P, γ = angle between R and P.

Consider a parallelogram OACB as shown in *figure-2* drawn from figure -1. ThesideOA,OB,diagonalOCrepresentstheforcesP,QandRrespectively.

From figure:

OA=BC =P; OB=AC =Q;

$$\angle AOC$$
=180 - β ;
 $\angle ACO$ = $\angle BCO$ =180 - α

IntriangleOAC;

$$\angle CAO = 180^{0} - (\angle AOC + \angle ACO)$$

$$= 180^{0} - (180 - \beta + 180 - \alpha)$$

$$\Rightarrow \angle CAO = \alpha + \beta - 180^{0}$$

But
$$\alpha + \beta + \gamma = 360^{\circ}$$

 $\Rightarrow \alpha + \beta - 180^{\circ} = 180 - \gamma$
 $\Rightarrow \angle CAO = 180 - \gamma$

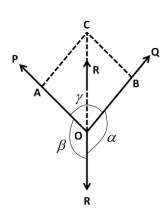

WeknowthatintriangleOAC,

$$\Rightarrow \frac{\frac{OA}{\sin \angle AC0}}{\frac{P}{\sin(180-\alpha)}} = \frac{\frac{AC}{\sin \angle A0C}}{\frac{Q}{\sin(180-\beta)}} = \frac{\frac{OC}{\sin \angle CA0}}{\frac{R}{\sin(180-\gamma)}}$$

$$\therefore \qquad \frac{P}{\sin \alpha} = \frac{Q}{\sin \beta} = \frac{R}{\sin \gamma}$$

(Proved)

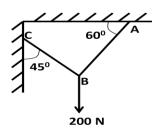

(Figure-2)

PROBLEM

Que-1) Anelectriclightfixtureofweight200Nissupportedas showninfigure. Determine the tensile forces in the wires BA and BC as shown in the figure.

Ans:

Consider the freebody diagram at B.

Let, T_{BC} = tension in wire BC,

T_{BA}=tensionin wire BA,

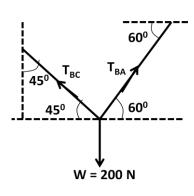

W=weightof lightfixture=200 N

The point Bisin equilibrium under the action of forces T_{BC} , T_{BA} and W.

ApplyingLami'stheoremto pointBweget;

$$\frac{T_{BA}}{\sin(90^0 + 45^0)} = \frac{T_{BC}}{\sin(90^0 + 60^0)} = \frac{200}{\sin 75^0}$$

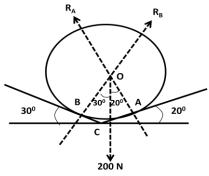

$$\Rightarrow \frac{T_{BA}}{\sin(135^{0})} = \frac{T_{BC}}{\sin(150^{0})} = \frac{200}{\sin75^{0}} \Rightarrow \frac{T_{BA}}{0.707} = \frac{T_{BC}}{0.5} = \frac{200}{0.965}$$

$$\Rightarrow T_{BA} = 0.707 \times \frac{200}{0.965} = 146.5N$$
 and $\Rightarrow T_{BC} = 0.5 \times \frac{200}{0.965} = 103.6N$ (Ans)

Que-2) A smooth circular cylinder of radius 2 m is lying in a triangular groove, one side of which makes 20° angle and other 30° angle with the horizontal. Find the reactions at the surfaces of contacts, if there is no friction and the cylinder weights 200 N.

Ans: Let,R_A=reaction at Aand R_B =reaction at B.W=weight of the body=200 N

20° 30° 150° 200 N

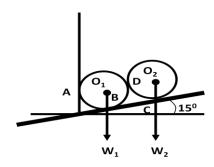

(Freebody diagram)

ApplyingLami's theorem to point 'O'we get;

$$\Rightarrow \frac{R_A}{\sin(150^0)} = \frac{R_B}{\sin(160^0)} = \frac{200}{\sin50^0} \Rightarrow \frac{R_A}{0.5} = \frac{R_B}{0.342} = \frac{200}{0.766}$$

$$\Rightarrow R_A = 0.5 \times \frac{200}{0.766} = 130.54N \quad \text{and} \Rightarrow \quad R_B = 0.342 \times \frac{200}{0.766} = 89.29N \quad (Ans)$$

Que-3) Two rollers of same diameter are supported by an inclined plane and vertical wall as shown in the figure. The upper and the lower rollers are respectively 300 N and 400 N in weight,. Find the reactions at points of contact A,B, C and D. Assumeall thesurfaces to be smooth.

Ans: Theupperroller remains in equilibrium under the action of following forces. Weight $(W_2) = 300 \text{ N}$, reaction at $C(R_C)$, and reaction of lower roller in the direction O_1O_2 (R_D) . Consider the equilibrium of upperroller.

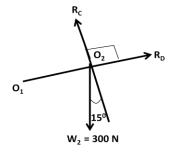

ApplyingLami's theorem to point O2, we get;

$$\Rightarrow \frac{R_D}{\sin 165^0} = \frac{R_C}{\sin 105^0} = \frac{300}{\sin 90^0}$$

$$\Rightarrow \frac{R_D}{0.258} = \frac{R_C}{0.965} = \frac{300}{1}$$

$$\Rightarrow R_D = 0.258 \times 300 = 77.4N$$
 and

$$\Rightarrow R_c = 0.965 \times 300 = 289.5N$$

The lower roller remains in equilibrium under the action of following forces.

Weight $(W_1) = 400 \text{ N}$, reaction at A (R_A) , reaction at B (R_B) and reaction of upper roller in the direction O_1O_2 (R_D) .

Considertheequilibrium of lower roller.

 $Resolving the forces along O_1O_2 we get; \, R_A$

$$\cos 15 - W_1 \sin 15 - R_D = 0$$

$$\Rightarrow$$
R_A× 0.966–400×0.259–77.4= 0

$$\Rightarrow$$
R_A= 187.37N.

 $Resolving the forces perpendicular to O_1O_2 we get; \ R_B-\\$

$$R_A \sin 15 - W_1 \cos 15 = 0$$

$$\Rightarrow$$
R_B= R_Asin15+ W₁cos15

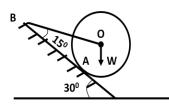

$$\Rightarrow$$
R_B= 187.37×0.258+ 400× 0.965

$$\Rightarrow$$
R_B= 434.34N

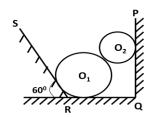

ASSIGNMENT

- **Que-1**)Abody ofweight70kNissuspendedby twostringswhoselengthsare6cmand8cm from two points in the same horizontal level. The horizontal distance between the two points is 10 cm. determine the tensions of the strings.(*Ans*: 42 kN, 56 kN)
- Que-2)Arollerofweight1000 Niskept onasmoothinclinedplaneand ispreventedfrom moving down by a rope as shown in the figure. Find the tension in the rope and the reaction at the point of contact A. (Ans: 731.8 N, 896.4 N)

Que-3)Twocylindersrestinachannelasshowninthefigure. Thebiggercylinderhasa diameter of 180 mm and weighs 500 N, where as the smaller cylinder has a diameter of 100 mm and weighs 200 N. If the bottom width of the box is 180 mm, with one side vertical and the other inclined at 60°, determine the reactions at all the four points of contact.

Moment of Force:

When a force act supon a body to turn it with respect to a point, the turning effect of force is called as moment of the force.

- ♣ Theproductofmagnitudeofforceandtheperpendicular distance of the line of action of the force from a point is known as moment of the force about that point.
- ♣ The<u>unit ofmoment</u>in S.Isystem is N-m.
- **A** Calculation of moment:

Consideraforce 'F' acting a tapoint Bof the bar of length 'l'.

MomentoftheforceaboutpointA= force \times distance = $F \times l$

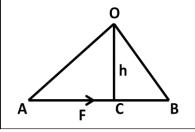

Consideraforce 'F' acting a tanangle 'O' at a point B of the bar of length 'l'.

MomentoftheforceaboutpointA= Force \times distance = F sin $\Theta \times l$

- * <u>Clockwisemoment</u>—Itisthemomentofaforcewhichproducestheturningeffectofthebody in clockwise direction. The clockwise moment is taken as positive
- ♣ <u>Anticlockwisemoment</u>—Itisthemomentofaforcewhichproducestheturningeffectofthe body in anticlockwise direction. The anticlockwise moment is taken as negative.
- Graphical representation of moment:

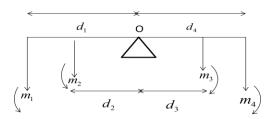

ConsideraforceFrepresentedinmagnitude and direction by the line AB. Let O is the point about which moment is required. Let OC is the perpendicular distance of O from AB. Join OA and OB to complete the triangle OAB.

Momentof forceF about point O =F×h=AB×OC =2 ×areaof triangle OAB

♣ *Law of* moments:

The principle of moment states that, "if a body is in equilibrium under the action of a number of parallel forces, the sum of the clockwise moments about any point must be equal to the sum of anti-clockwise moments about the same point".

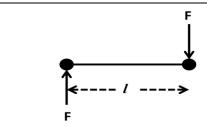

According to the principle of moments, Sumofanti-clockwise moments = sumofclockwise moments From figure, $m_1d_1 + m_2d_2 = m_3d_3 + m_4d_4$

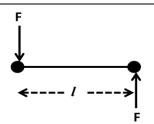

Couple:

Twoequal and opposite parallel forces acting at different points in a body forms a couple.

- ♣ Abodyacteduponbythecouplewillrotatethebodyinclockwisedirectionoranti-clockwise direction.
- * Steeringwheelandpedalsofbicyclesaretheexamples forcouple, wherethetwoforcesare equal but acting in opposite direction.
- *♣ Moment of the couple: It is the product of one of the forces and the arm of the couple.*
- **♣** *Typesofcouple*:

<u>Clockwise couple</u>: It is the couple producedby a pair of forces which tends to rotate the body in clockwise direction. It is taken as positive couple.

<u>Anticlockwise couple</u>: It is the couple produced by a pair of forces which tends to rotatethebodyinanticlockwisedirection. It is taken as negative couple.

- * The algebraic sum of the forces forming the couple is zero.
- Acouple canbebalancedbyanothercouple of equal magnitude and opposite reaction.
- * Examples of couple: opening or closing of awatertap, turning of the cap of apen.

Varignon'stheorem:

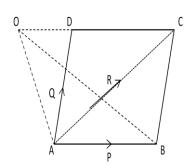

It states that, "if a number of coplanar forces are acting simultaneously on a particle; the algebraic sum of moments of all the forces about any point is equal to the moment of their resultant force about the same point".

Proof:

ConsidertwocoplanarforcesPandQberepresentedinmagnitudeanddirectionbythesidesABand AD of the parallelogram as shown in figure. The diagonal AC represents the resultant of forces in magnitude and direction.

Let'O'beanypointasO,DandClieonsameline. Join OD, OA and OB.

Moment of force P about point 'O' = $2 \times$ area of triangle AOB Moment of force Q about point 'O' = $2 \times$ area of the triangle AOC MomentofforceRaboutthepoint 'O'= $2 \times$ area of the triangle AOD

Fromgeometryoffigure:

Areaof \triangle AOD = areaof \triangle AOC+areaof \triangle ACD \Rightarrow 2×Areaof \triangle AOD=(2×areaof \triangle AOC)+(2 ×areaof \triangle ACD) but , areaof \triangle ACD = area of \triangle ADB = area of \triangle AOB sowemaywrite,

- \Rightarrow 2×Areaof \triangle AOD=(2 ×areaof \triangle AOC) +(2×areaof \triangle AOB)
- ⇒ Momentof R aboutO = Momentof QaboutO + Momentof P about O
- : HencethealgebraicsumofmomentsoftwoforcesPandQaboutpointOisequaltothemoment of the resultant R about the same point O. (*Proved*)

PROBLEM

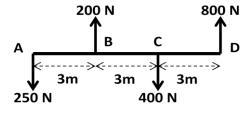

- **Que-1**) Ahorizontalmember issubjectedto asystemof parallelforcesas shownin figure. Determinethe magnitudeandpositionoftheresultant force.
- **Ans:** Magnitudeofresultant force:

Resultant=
$$-250 + 200 - 400 + 800 = 350 \text{ N}$$

Positionofresultantforce:

Let *x* = distance of resultant from A ConsiderthesumofmomentaboutpointA;

$$R \times x = 800 \times 9 - 400 \times 6 + 200 \times 3 \Rightarrow 350x = 5400$$

 $\Rightarrow x = 5400/350 = 15.42m$

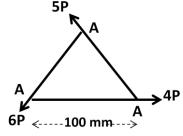

- :. The magnitude of Ris 350 Nacting upward and it is at a distance 15.42 m from A.
- **Que-2**) Threeforcesof4P,5Pand6Pareactingalongthethreeedgesofanequilateraltriangleof 100 mm side taken in order. Determine the magnitude and position of the resultant force.
- **Ans:** Consider the equilateral triangle ABC as shown in figure.

Resolving all forces horizontally and taking their sum;

$$\sum H = 4P - 5P\cos 60 - 6P\cos 60 = 4P - 5P(0.5) - 6P(0.5)$$
$$= 4P - 2.5P - 3P = -1.5 P$$

Resolvingall forces vertically and taking their sum;

$$\sum V = 5P\sin 60 - 6P\sin 60 = 5P(0.866) - 6P(0.866)$$
=4.33 P - 5.19 P =-0.86

ResultantR=
$$\sqrt{(\sum H)^2 + (\sum V)^2} = \sqrt{(-1.5P)^2 + (-0.86P)^2} = \sqrt{2.25P^2 + 0.73P^2}$$

= $\sqrt{2.98P^2} = 1.72P$ (magnitudeofR)

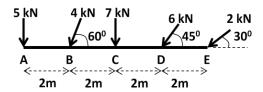

Let *x*=perpendicular distance between point B and the line of action of resultant force Consider sum of moment of forces about point B and equating with zero.

$$1.72P \times x = 5P\sin 60 \times 100 = 433.012P \qquad \Rightarrow x = \frac{433.012}{1.72} = 251.75mm$$

:. Theresultant offorcesR isat a distanceof251.75mm frompoint B. (position ofR)

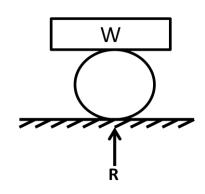

ASSIGNMENT

- **Que-1**) A uniform wooden plank MN of length 5 m weighs 50 N. It is supported at end M at a point S, 1 m from the other end N. Determine the maximum weight W that can be placed at the end Nso that the plank does not topple. (*Ans*:75 N)
- **Que-2**) For the following system of forces determine the magnitude, direction and position of the resultant force. (*Ans*: 22.19 kN, 68.94⁰, 3.30 m)

Built-in Support:

FRICTION

Friction:

Theamountofresistanceforcedevelopedbetweentwosurfacesofcontactwhenonebodymovesover another is called as *friction*. *Force of friction* is an opposing force which resists the motion of one body over another and it always acts in the direction opposite to the direction of applied force.

Factorsinfluencingfriction:

- ♣ Typeofmaterial
- Roughnessofthesurfacesof contact
- ♣ Weightofthe movingbody
- Nature of motion of the body

Differenttypesof friction:

- Onthebasis of nature of material friction can be classified as dryand fluid friction.
- Onthebasis of state of restor motion friction can be classified as static and dynamic friction.
- **Static friction:** There is a limit of frictional force beyond which it can't increase. When the applied force is less than this limiting friction, the body remains at rest and when the applied force is more than this limiting friction, the body comes in motion. This friction is called as static friction.
- * Dynamicfriction: It isthefriction experienced by a body, when thebodyis in motion. It is less than the static friction. Dynamic friction is further classified as:

 **Slidingfriction*: It is the friction experienced by a body, when it is sliding over another body.

 **Rollingfriction*: It is the friction experienced by a body, when it is sliding over another body.

Lawsof staticfriction:

- Theforceoffrictionisdirectlyproportionaltonormalreactionandalwaysoppositein direction of motion.
- ♣ Themagnitude of the limiting friction (F) bears a constant ratio to the normal reaction (R_N) between the two surfaces. i.e. $F/R_N = Constant$
- * Theforceoffriction is independent of the area of contact between the two surfaces.
- * Theforceof frictiondepends upon theroughnessorsmoothnessofthe body.
- * Theforceoffriction is independent of sliding velocity.

Limitingfriction:

Itisthemaximumvalueoffrictionalforceexperiencedbythebody, when thebodyjustbeginstoslide over the surface of another body.

Coefficient of friction:

Itistheratiobetweenthe limitingfriction (F)andthe normalreaction(R_N). It is denoted by '.

i.e.= F/R_N

- * If Fis theforcenecessarytostart sliding, then is known as coefficient of static friction.
- ♣ IfFistheforcenecessarytomaintainslidingofamovingbody,then isknownas coefficient of kinetic friction.
- * Coefficientofkinetic friction is less than the coefficient of static friction.

Angleofinclination:

Itistheanglemadebytheinclinedplanewiththehorizontalplane. Itisdenotedby' α '. Limiting angle

of friction:

It is the angle between the resultant limiting friction and the normal reaction. It is the angle made by the resultant of frictional force and normal reaction with normal reaction. It is denoted by \emptyset .

$$\tan \emptyset = \mu = \mathbf{F} / \mathbf{R}_{\mathbf{N}} \quad \text{OR}$$

$$\emptyset = tan^{-1}(\mu)$$

Angle of Repose:

It is the maximum angle made by the inclined plane with the horizontal plane when a body starts moving without the application of force. The body begins to slide when the angle of inclination of the plane is equal to the angle of friction. i.e. $\mu = \emptyset$.

Equilibrium of abody on arough horizontal plane:

Case − *1*

Considerabodyon aroughhorizontal planeas shown infigure.

Let, W=weightofthe body

R_N=normal reaction

 $\mu\text{=}coefficient of friction$

P=effort required to move the body

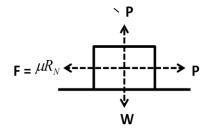

Forequilibrium the following condition may consider.

$$\Sigma H = P - F = 0$$

$$\Rightarrow$$
 P=F= μ R_N.....(i)

$$\sum V = R_N - W = 0$$

Replacing the value of R_{N} in equation - (i) we get,

Case-2

Considerabodyon aroughhorizontal planeas shown infigure.

Let, W = weightofthe body

R_N=normal reaction

u=coefficientoffriction

P=effort required to move the body

Forequilibrium the following condition may consider:

$$\Sigma H = P \cos\theta - F = 0$$

$$\Rightarrow$$
 P cos θ - μ R_N=0-----(i)

$$\sum V = R_N + P \sin \theta - W = 0$$

$$\Rightarrow$$
 R_N=W-Psin θ -----(ii)

Replacing the value of R_N in equation—(i) we get, P $cos\theta - \mu R_N = 0$

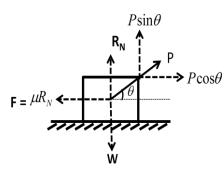

$$\Rightarrow$$
 Pcos θ - μ W+ μ P sin θ =0

$$\Rightarrow$$
 Pcos θ + μ P sin θ = μ W

$$\Rightarrow$$
 P(cos θ + μ sin θ)= μ W

$$\therefore \qquad \mathbf{P} = \frac{\mathbf{u}\mathbf{W}}{\cos\theta + \mathbf{\mu}\sin\theta} \qquad (iii)$$

Replacing the value of u

$$=\tan\emptyset = \sin\emptyset$$
we get:

When $\theta = \emptyset$, P will be minimum

i.e. **Pmin**=WsinØ

Equilibrium of abodyonaroughinclined plane:

Case - 1

Considerabodymovinguptheinclinedplanewhichisinclinedwithanangle ' α ' with the horizontal plane. Consider *P* is the effort applied parallel to the inclined plane.

When the bodyslides downward:

Let, W=weightofthe body α =angle of inclination

Ø=limitingangleoffriction P=effortrequired

R_N=normal reaction

 $Resolving all the forces perpendicular the plane, \, R_{\rm N}$

$$=$$
 W cos α -----(i)

Resolvingtheforcesparalleltotheplane, P

$$=$$
 W $\sin \alpha - \mu R_N$ (ii)

PuttingthevalueofR_Ninequation-(ii),weget P =

$$W \sin \alpha - \mu W \cos \alpha$$

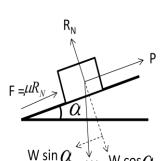

$$P = W(\sin \alpha - \mu \cos \alpha)$$
-----(iii)

Replacing the value, $\mu = \frac{\sin \phi}{\cos \phi}$, we get

$$\Rightarrow P=W(\sin \alpha - \frac{\sin \emptyset}{\cos \emptyset} \times \cos \alpha)$$

$$=W(\frac{\sin \alpha \cdot \cos \emptyset - \sin \theta \cdot \cos \alpha}{\cos \emptyset})$$

$$\Rightarrow \qquad \mathbf{P} = \frac{\mathsf{W}\sin(\alpha - \emptyset)}{\mathsf{Cos}\emptyset} \qquad \qquad ------(iv)$$

Whenthebodymovingup:

Let, W=weightofthe body α =angle of inclination \emptyset =limiting angle of friction α =angle of inclination α =angle of α

Resolvingalltheforcesperpendiculartheplane, R_N

$$=$$
 W cos α ------(i)

Resolving the forces parallel to the plane,P

$$= W \sin \alpha + \mu R_N - (ii)$$

 $Putting the value of R_{N} in equation \hbox{-} (ii), we get \ P =$

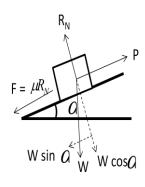

$$\begin{array}{ccc}
W \sin \alpha + \mu W \cos \alpha \\
\hline
P = W(\sin \alpha + \mu \cos \alpha)
\end{array} - - - - (iii)$$

Replacing the value, $\mu = \frac{\sin \phi}{\cos \phi}$ we get

$$\Rightarrow P=W(\sin \alpha + \frac{\cos \theta}{\cos \theta} \times \cos \alpha) =$$

 $W(\frac{\sin\alpha.\cos\emptyset+\sin\emptyset.\cos\alpha}{}$

$$\Rightarrow \qquad \boxed{\mathbf{P} = \frac{\frac{\cos\emptyset}{\text{Wsin}(\alpha + \emptyset)}}{\cos\emptyset}} \qquad - \cdots (iv)$$

Case - 2

Considerabodymovinguptheinclinedplanewhichisinclinedwithanangle ' α ' with the horizontal plane. Consider *P* is the effort applied parallel to the horizontal plane.

When the bodyslides downward:

Let, W=weightofthe body

 α = angle of inclination

Ø=limitingangleoffriction

P=effortrequired

R_N=normal reaction

Resolvingalltheforcesperpendicularthe plane,

$$R_N=W\cos\alpha+P\sin\alpha-\dots$$
 (i)

Resolvingtheforces paralleltothe plane,

Pcos
$$\alpha$$
=Wsin α - μ R_N.....(ii)

Puttingthe valueofR_Ninequation-(ii), weget

Pcos α=Wsinα-
$$\mu$$
(W cosα+P sin α)

= Wsin
$$\alpha$$
 - μ Wcos α - μ Psin α

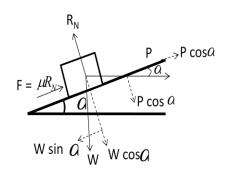

$$\Rightarrow$$
 P cosα+ μ P sinα= Wsinα - μ Wcos

$$\Rightarrow$$
 P (cos $\alpha + \mu \sin \alpha$)=W(sin $\alpha - \mu \cos \alpha$)

$$\Rightarrow \qquad \boxed{\mathbf{P} = \mathbf{W} \times \frac{\sin \alpha - \mu \cos \alpha}{\cos \alpha + \mu \sin \alpha}} \qquad \qquad (iii)$$

Replacing the value, $\mu = \frac{\sin \varphi}{\cos \varphi}$

$$\Rightarrow \qquad P = W \times \frac{\frac{\sin \theta}{\cos \theta} \cdot \cos a}{\cos a + \frac{\sin \theta}{\cos \theta} \cdot \sin a} \cdot \sin a$$

$$\Rightarrow \qquad P=W\times (\frac{\sin\frac{\alpha.\cos\phi-\sin\phi.\cos\alpha}{\cos\alpha.\cos\phi+\sin\alpha\sin\phi}}{\cos\alpha.\cos\phi+\sin\alpha\sin\phi})$$

$$\Rightarrow P = \frac{W\sin(\alpha - \emptyset)\cos(\alpha)}{-\emptyset}$$

$$\Rightarrow$$
 P=Wtan(α - \emptyset)

or
$$\mathbf{W} \operatorname{tan}(\emptyset - \alpha)$$
 (iv)

When the bodymovesup:

Ø=limitingangleoffriction

 α =angle of inclination

P=effortrequired

R_N=normal reaction

Resolving all the forces perpendicular the plane,
$$R_{\mathrm{N}}$$

$$= W \cos \alpha + P \sin \alpha$$

Resolvingtheforces paralleltothe plane,

$$P\cos\alpha = W\sin\alpha + \mu R_N \tag{ii}$$

Puttingthe valueofR_Ninequation-(ii), weget:

Pcos α=Wsinα+
$$\mu$$
(W cos α+P sin α)
=Wsinα + μ Wcosα + μ Psinα

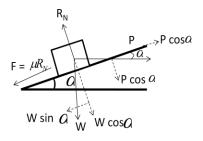

⇒Pcosα -
$$\mu$$
Psinα= Wsinα + μ Wcosα

$$\Rightarrow$$
P (cos α - μ sin α)= W(sin α + μ cos α)

$$\Rightarrow \mathbf{P} = \mathbf{W} \times \frac{\sin \alpha + \mu \cos \alpha}{\cos \alpha - \mu \sin \alpha}$$
 (iii)

Replacing the value, $\mu = \frac{\sin \emptyset}{\cos \emptyset}$ we get

$$\Rightarrow P = W \times \frac{\sin a + \frac{\sin \emptyset}{\cos \emptyset} \cdot \cos a}{\cos a - \frac{\sin \emptyset}{\cos \emptyset} \cdot \sin a} \cdot \sin a$$

$$\Rightarrow P = W \times (\frac{\sin \alpha \cdot \cos \emptyset + \sin \theta \cdot \cos \alpha}{\cos \alpha \cdot \cos \emptyset - \sin \alpha \sin \emptyset})$$

$$\Rightarrow P = \frac{W \sin(\alpha + \emptyset)}{\cos(\alpha + \emptyset)}$$

$$\Rightarrow$$
P=**W** tan(α + \emptyset) ____(iv)

PRACTICEQUESTIONS

Problem-1: Abodyweighing20kNrestingonaroughhorizontalplanecanjustbemovedbyahorizontal force of 5 kN. Determine the coefficient of friction and total reaction.

Problem-2: Abodyofweight300Nislyingonaroughhorizontalplanehavingacoefficientoffrictionas 0.3.Findthemagnitudeofforce, which can move the body; while acting at an angle of 25° with the horizontal.

Problem-3: Abodyrestingonahorizontalplanecanbemovedslowlyalongtheplanebyahorizontalforce of 10 kN. A force of 9 kN inclined at 30° to the horizontal direction will suffice to move the block along the same direction. Determine the coefficient of friction and weight of the body.

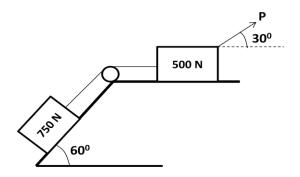

Problem-4: Abodyrestingonaroughhorizontalplanerequiredapullof180Ninclinedat30°totheplane just to move it. It was found that a push of 220 N inclined at 30° to the plane just moved the body. Determine the weight of the body and coefficient of friction.

Problem-5: A body of weight 500 N is laying on a rough plane inclined at an angle of 25⁰ with the horizontal. It is supported by an effort Pparallel to the inclined plane. Determine the maximum and minimum values of force P for which the equilibrium can exist, if the angle of friction is 20⁰.

Problem-6: An object of weight 100 N is kept in position on a plane inclined 25⁰ to the horizontal by a horizontallyappliedforce. If the coefficient of friction of the surface of the inclined plane is 0.25, determine the maximum and minimum magnitude of force for which equilibrium can exists.

Problem-7:Aforce of 150 Nisappliedjust tomove abody upaninclined plane of angle 10⁰ parallel to the plane. When the angle of inclination of the plane is increased to 30⁰, the force required parallel to the plane becomes 300 N. What is the weight of the body and coefficient of friction?

Problem-8: What is the value of P in the systemshown in figure tocause the motion of a 500N block to rightside? Assumethepulleyiss mooth and the coefficient of friction between other contact surfaces is 0.20.

Ladder friction:

A ladder is supported at its two ends where friction plays an important role. Consider a ladder ABwhoseoneend(A)issupportedonground/floorandtheotherend(B)issupportedonwall as shown in figure.

Let, W = weight of the ladder $AB = \text{lengthofladder} = l R_A$ = reaction force at A. $R_B = \text{reaction force at B}$.

 F_A = friction at the end A between the floor and ladder.

 F_B =frictionatthe endBbetweenthe wallandladder.

 μ_A =coefficient offrictionbetween floor and ladder.

 $\mu_{\rm B}$ =coefficient of frictionbetween wall and ladder.

Forequilibrium of ladder the sum of horizontal forces and sum of vertical forces must be zero.

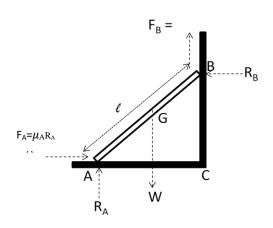

Considering $\Sigma H = 0$, we get

$$F_A = \mu_A R_A = R_B$$
....(1)

Considering∑ V=0,weget R_A

$$+ F_B = W$$

$$\Rightarrow$$
R_A+ μ _BR_B=W-----(2)

Problem-1: A uniform ladderoflength3.25 m and weighing 250 N is placed against a smoothvertical wall with its lower end 1.25m from the wall. The coefficient of friction between the ladder and floor is0.3. Whatisthefrictional forceacting on the ladder at the point of contact between the ladder and the floor? Show that the ladder will remain in equilibrium in this position.

Solution: <u>DataGiven:</u>

Length of ladder (1) = 3.25 m

Weightof ladder (W) =250 N

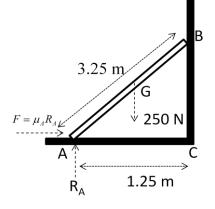

AC=distancebetweenlowerend ofladderand wall

Coefficientoffrictionbetweenladderandfloor at A $=\mu_A=0.3$

Let F_A =frictional force at A= $\mu_A R_A R_A =$ normal reaction at A

There is no friction between ladder and wall at B. Resolvingtheforces vertically and equating the sum to zero we get: $R_A = W = 250 \ N$

From figure: BC =
$$\sqrt{(3.25)^2-(1.25)^2}$$
 = 3m

Takingmomentabout Bandequatingthesumofmomentstozeroweget:

$$(F_A \times 3) + (250 \times 0.625) - (R_A \times 1.25) = 0$$

$$\Rightarrow F_A = \frac{250 \times 1.25 - 250 \times 0.625}{3} = 52.1N$$
(ANS)

We knowthat: $F_A = \mu_A R_A = 0.3 \times 250 = 75N$

Astheforceoffrictionavailablei.e.75Nismorethantheforceoffrictionrequired to keep the ladder in equilibrium, thus the ladder will remain in equilibrium.

Problem-2: A ladder 5 meters long reston a horizontal ground and leans against asmoothvertical wall at an angle 70° with the horizontal. The weight of the ladder is 900 N and acts at itsmiddle. The ladderisatthepointofsliding, whenamanweighing 750N standsontherung 1.5 meterfrom the bottom of the ladder. Calculate the coefficient of friction between the ladder and the floor.

Solution: <u>DateGiven:</u>

Length of ladder AB (l) = 5 m Weightofladder(W_1)=900N Weight of man (W_2) = 700 N

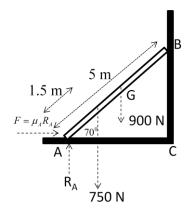

Distance between lower end of ladder and the point where the man stands = 1.5 m

Let

Coefficientoffrictionbetweenladderandfloor at A $=\mu_A$

Frictional forceat $A(F_A) = \mu_A R_A$ Normal reaction at $A = R_A$

Thereisnofrictionbetween ladderandwallatB.

Resolving the forces vertically and equating the sum of forces with zero we get:

$$R_A = 900 + 750 = 1650N$$

Forceoffrictionat A=
$$F_A$$
= $\mu_A R_A$ =1650 μ_A ----- (1)

Taking the moment about Band equating the sum of moments with zero we get:

$$R_{\frac{1}{A}}5\sin 20^{0} - F \times 5c_{0}\cos 20^{0} - 900 \times 2.5\sin 20^{0} - 750 \times 3.5\sin 20^{0} = 0$$

 $\Rightarrow R_{A} \times 5\sin 20^{0} = F_{A} \times 5\cos 20^{0} + 900 \times 2.5\sin 20^{0} + 750 \times 3.5\sin 20^{0}$

- $\Rightarrow R_{\text{A}} 5 \sin 20^{0} = \mu R \times 5 \cos 20^{0} + 900 \times 2.5 \sin 20^{0} + 750 \times 3.5 \sin 20^{0}$ $\Rightarrow 1650 \times 5 \sin 20^{0} = \mu \times 1 \cos 20^{0} + 900 \times 2.5 \sin 20^{0} + 750 \times 3.5 \sin 20^{0}$
- $\Rightarrow \quad \mu_{\text{A}} 1650 \times 5 cos 20^0 = 1650 \times 5 sin 20^0 900 \times 2.5 sin 20^0 750 \times 3.5 sin 20^0$

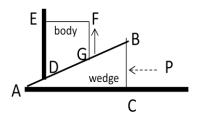

$$\Rightarrow \quad \mu_{A} = \frac{1650 \times 5 sin20^{0} - 900 \times 5 sin20^{0} - 750 \times 3.5 sin20^{0}}{1650 \times 5 cos20^{0}} = 0.15 \tag{ANS}$$

Wedgefriction:

A wedge is a triangular or trapezoidal cross section element madeupofmetalorwood. It is used for lifting heavy loads, for tightening fits or keys of shaft etc.

When lifting loads, wedge is placed below the load and a horizontal force P is applied. The wedge moves towards left and the load moves upward.

In figure the position of wedge and load is shown. There is a sliding at the surfaces AB, AC and ED.

Infiguretheforcesactingonthewedgeandthebodyare shown.

In figure:

W=weight of the bodyDEFG

P=forcerequiredto liftthebody

 μ =coefficient of frictionon theplanesAB, ACand DE =tan \emptyset

 R_1 =resultantofnormalreactionandforceoffrictionatthe inclined plane AB

 R_2 =resultantofnormalreactionandforceoffrictionatthe horizontal plane AC

 F_1 = frictional force at the inclined planeAB

F₂=frictionalforceatthehorizontalplaneAC

Forces on the body DEFG

Forces on the wedge ABC

Problem-3: Ablockweighing 1500N, overlying a 10⁰ wedge on a horizontal floor and leaning against a vertical wall is to be raised by applying a horizontal force to the wedge. Assuming the coefficient of friction between all the surfaces in contact to be 0.3, determine the minimum horizontal force required to raise the block.

Solution:

Data Given:

Weightofblock(W)=1500N Angleof

the wedge (α) = 10^0

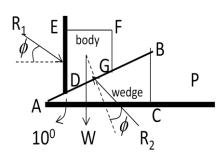

Coefficient of friction at all contact surfaces (μ)

=0.3

LetP=minimumhorizontalforcerequiredtoraise the load

ThebodyDEFGisinequilibriumbytheforces:

W=1500N, reaction R₁ at DE and reaction R₂ at DG

$$\mu = \tan \emptyset = 0.3$$
 \Rightarrow $\emptyset = \tan^{-1}(0.3) = 16.7^{\circ}$

Resolving the forces horizontally: $R\cos(16.7^{\circ}) = R \sin(10^{\circ} + 16.7^{\circ}) = R \sin(26.7^{\circ})$

$$\Rightarrow R_1 \times 0.9578 = R_2 \times 0.4493$$
 $\Rightarrow R_2 = 2.132R_1$

Resolving the forces vertically: $R\sin(16.7^{0}) + 1500 = R\cos(10^{0} + 16.7^{0}) = R$ $\cos(26.7^{0})$

$$\Rightarrow R_1 \times 0.2874 + 1500 = R_2 \times 0.0.8934$$

$$\Rightarrow R_1 \times 0.2874 + 1500 = (2.132R_1) \times 0.0.8934 = 1.905R_1$$

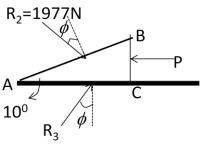

$$\Rightarrow R_1 \times (1.905 - 0.2874) = 1500$$

$$\therefore R_1 = \frac{1500}{1.6176} = 927.3N$$

and R_2 =2.132× R_1 =2.132×927.3=1977N

Consider the equilibrium of the wedge. The free body diagram is shown in figure.

The wedge is in equilibrium by the forces: reaction R_2 of the block on the wedge, force P acting horizontally and reaction R_3 on the face AC.

Resolvingtheforcesvertically:

$$R\cos 16.7^0 = R \cos(10^0 + 16.7^0) = R \cos 26.7^0$$

$$\Rightarrow R_3 \times 0.9578 = R_2 \times 0.8934 = 1977 \times 0.8934 = 1766.2$$
$$\Rightarrow R_3 = \frac{1766.2}{0.9578} = 1844N$$

Resolvingtheforceshorizontally:

$$P=R_{2}\sin(10+16.7)+R\sin 16.7=1977\sin (26.7)+1844\sin 16.7$$

$$3$$

$$\Rightarrow P=(1977\times 0.4493)+(1844\times 0.2874)=1418.3N$$

Axisofreference:

These are the reference axis about which the location of Centre of gravity is calculated. For plane figuresthelowestline considered as reference axis to determine \bar{y} and the left line is considered as the reference axis to determine \bar{x} .

Centroidofarectangularlamina:

Considerarectangularlaminaofwidth'b'anddepth'd'as shown in figure.

Letw=weightperunit area \bar{x} =distanceofC.GofareafromY-axis \bar{y} distance of C.G of area from X-axis Area of rectangle = b×d

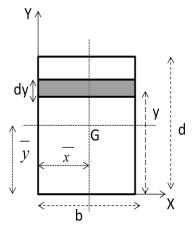

Consideranelementarystripofsmallthickness'dy'ata distance 'y' from the base (X-axis) as shown in figure.

Area of the strip = $b \times dy$

Momentof this areaabout X-axis = $b \times dy \times y$

The algebraic sum of the moments of all such elementary area about X-axis = $\int_{0}^{d} (b \times y \times dy)$

Momentof totalareaWabout X-axis= $b \times d \times \bar{y}$

According to law of moments:

$$b \times d \times \overline{y} = \int_{0}^{d} (b \times y \times dy)$$

$$\Rightarrow b \times d \times \overline{y} = b \times \int_{0}^{d} (y \times dy) = \int_{0}^{d} dy = \int_{0}^{2} \frac{1}{2}$$

$$\Rightarrow \overline{y} = \frac{1}{2}$$

$$\Rightarrow \overline{y} = \frac{1}{2}$$

Similarlywecan get: $\bar{x}=b - \frac{1}{2}$::centroidofrectangularlaminais $\frac{(b,d)}{2}$

Centroidof asquare lamina:

CentroidofasquarelaminacanbeobtainedsimilartoCentroidofrectangularlamina. If the

sides of a square lamina is 'a', then its Centroid is given by $(a, a) = \frac{1}{22}$

Centroidofacircularlamina:

Consideracircularlaminaofcentre'O'andradius'R'as shown in figure.

ConsideranypointP and Qon itscircumferencesuchthat $\angle XOP = \theta \& \angle POQ = d\theta$

AssumePandQarecloserandPQisastraightlinesuch that OPQ may be a triangle.

LetG₁is theC.G ofelementarystrip OPQ.

$$OG_1={}^2OP={}^2R$$

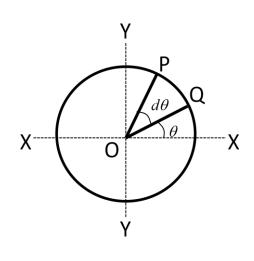

Perpendicular distance of the point G_1 from the axis XOX^1 = ${}^2R\sin\theta$

Perpendicular distance of the point G_1 from the axis YOY^1 = ${}^2\mathbf{R}\mathbf{cos}\theta$

Momentof thisarea aboutaxis $Y^1OY=1 \times R^2 d\theta \times {}^2R\cos\theta = 1 \times R^3.\cos\theta.d\theta$

The algebraic sum of the moments of all such elementary are a about axis Y OY

$$= \int_0^{2\pi} \left(\frac{1}{3} \times R^3 \cdot \cos\theta \cdot d\theta\right) \qquad = \frac{1}{3} \times R^3 \cdot \int_0^{2\pi} \left(\cos\theta \cdot d\theta\right) - \cdots (1)$$

Totalarea of the circular lamina $=\pi R^2$

LetGbetheC.Gofthecircularlaminawhichisatadistance \bar{x} and \bar{y} from Y¹OY and X¹OX axis respectively.

MomentoftotalareaaboutY 1 OYaxis= $\pi R^{2} \times \bar{x}$ -----(2)

Equating 1 and 2 we get:
$$\pi R^2 \times \bar{x} = {}^{1} \times R_{\frac{3}{3}} \int_{0}^{2\pi} (\cos \theta . d\theta)$$

$$\Rightarrow \qquad \pi . \underline{\bar{x}} = {}^{1} \times R \int_{0}^{2\pi} (\cos \theta . d\theta) = {}^{1} \times \underline{R} \times] \sin \theta]^{2\pi}$$

$$\Rightarrow \qquad \bar{x} \qquad \frac{-(\sin 2\pi - 0)}{\bar{x}} = 0$$

$$\Rightarrow \qquad \bar{x} \qquad \frac{-(\sin 2\pi - 0)}{\bar{x}} = 0$$

Similarly: $\bar{y} = 0$

:Thecentroid of circular lamina liesatits centre.

Centroidofatriangular lamina:

ConsideratriangularlaminaABCofbase'b'andheight'h'. Consider an elementary strip of very small thickness 'dy' parallel to its base at a distance 'y' from its base BC.

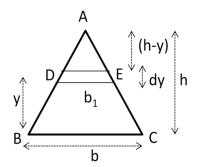

Letb₁=width of theelementarystrip w=weightper unit area f the lamina dA =area of theelementarystrip = $b_1 \times dy$

Fromthetwosimilartriangles ADEandABCwe get:

$$\frac{b_1}{b} = \frac{h - y}{h} \implies b_{\overline{1}} = \frac{b(h - y)}{h}$$
areaofelementarystrip=
$$\frac{b(h - y) \times dy}{h}$$
Momentof elementaryareaabout baseBC
$$= \frac{b(h - y)}{h} \times dy \times y$$

Algebraic sum of the moments of all such elementary area about base $BC = \int_0^h \left(\frac{b(h-y)}{h} \times dy \times y\right)$ (1)

AreaofthetriangleABC= 1 bh $_{\frac{1}{2}}$ Moment ofareaaboutbaseBC= 1 bh $_{\frac{1}{2}}$ \bar{y} ------ (2)

Equating 1 & 2 we get; $\frac{1}{2}bh \times \bar{y} = \int_{0}^{h} {bh - y \choose 0} \times dy \times y)$ $= \int_{0}^{h} (by - b^{y}) \times dy$ $\Rightarrow \frac{1}{2}bh \times \bar{y} = b\int_{0}^{h} (y_{0}^{-y}) \times dy$ $\Rightarrow \frac{1}{2}h \times \bar{y} = \int_{0}^{h} y_{0} dy - \int_{0}^{hy} \times dy$ $= \int_{0}^{y^{2}} \int_{0}^{h} (-1 \times \frac{1}{2}y^{3}) \int_{0}^{h} (-1 \times \frac{1}{2}y^{3}$

∴ Centroid oftriangular laminais h from its base and h from its apex.

Centroidof asemicircularlamina:

Considerasemicircularlaminaofradius'r'asshown in figure.

 $Consider the elementary are a OPQ such \ that$

$$\angle POQ = d\theta$$
 and $\angle BOP = \theta$

AreaofOPQ=
$${}^{1}r^{2}d\theta$$

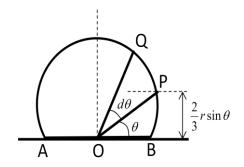

Distance of centroid of the elementary area is 2 r from 'O'. Height of centroid of the elementary area above $AB = ^2$ r $\sin \theta$

Momentoftheelementaryarea about AB $= {}^{1}\mathbf{r}^{2}d\theta \times {}^{2}\mathbf{r}\sin\theta = {}^{1}\mathbf{r}^{3}\sin\theta d\theta$ $= {}^{3}\mathbf{r}^{3}\sin\theta d\theta$

Momentof whole area about AB
$$= \int_0^{\pi} (\frac{1}{3} r^3 \sin \theta . d\theta) = \frac{1}{3} r^3 \int_0^{\pi} (\sin \theta . d\theta)$$

$$= \frac{1}{3} - \cos \theta \int_0^{\pi} \frac{1}{3} [-\cos \pi + \cos \theta]$$

$$= \frac{1}{3} - \cos \theta \int_0^{\pi} \frac{1}{3} (1)$$

Let **\frac{1}{2}\text{height of centroid above AB}

Area of the semicircle =
$$\pi r \frac{2}{3}$$

MomentaboutAB=
$$\pi r \bar{x}_{\frac{1}{2}}$$
 (2)

From1 and 2 weget:

$$\Rightarrow \frac{\pi r^2}{2} \bar{y}^2 r^3 = 3 \Rightarrow \bar{y}^{4r} = 3\pi$$

: Thecentroid of these micircular lamina is at a distance 4r from its base taken on Y-Yaxis.

Area $(A_2) = 60 \times 20 = 1200 \text{ mm}^2$ DistanceofC.GofthisrectanglefromAB(x_2)=50mm Distance ofC.G of thisrectangle from BC(y_2) = 10 mm

MOMENTOFINERTIA:

Momentofinertiaofaplaneareaisthemomentoffirstmomentofarea. It isknownassecond moment of inertia.

M.I ofplanelamina:

Consideraplanelaminawhosemomentofinertiais required about X-X axis and Y-Y axis.

Considerastripin the planefigureasshown in figure.

Let: dA=area of the strip

x=distanceofC.GofthestriponX-Xaxis

y=distanceof C.G of the strip on Y-Yaxis

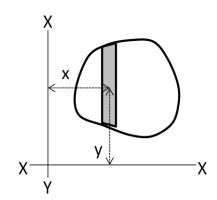

M.IofthestripaboutY-Y axis=dA.x²

M.Iofthewholeareacanbeobtainedbyintegratingthe above expression. We may get:

$$I_{YY} = \sum dA.x^2$$

and

$$I_{XX} = \sum dA.x^2$$

Perpendicularaxis theorem:

Itstatesthat, 'the sum of moment of inertia of an area about wo mutually perpendicular and coplanar axes is equal to the moment of inertia of the area about an axis which is perpendicular to both the above axes'.

Proof:

Consider a small lamina P of area 'da' at a distance 'x' formOY-axisand'y'formOX-axisasshowninfigure. OX and OY are the two mutually perpendicular axes.

Let,OZaxisisperpendiculartoOXandOYand'r'is the distance of the lamina from this axis.

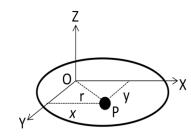

From geometry:
$$r^2 = x^2 + y^2$$
 (1)

 $\label{eq:momentofinertia} Momento finertia of the lamina Pabout X-Xaxis = \\ Momento finertia of the lamina Pabout Y-Yaxis = \\ I_{YY} = \\ da.x^2$

MomentofinertiaofthelaminaPaboutZ-Zaxis= I_{ZZ} = da r_2

From equation-1 we get:

$$r^2 = x^2 + y^2$$
 $\Rightarrow da.r^2 = da.x^2 + da.y^2$
 $\therefore I_{ZZ} = I_{XX} + I_{YY}$

I_{XX}=da.y²

 $I_{YY}=da.x^2$

Parallelaxis theorem:

It states that, 'the moment of inertia of an area about a non-centroidal axis is equal to the moment of inertia of the area about its centroidal axis which is parallel to the non-centroidal axisplustheproductofthemagnitude of the area and the square of the distance of the C. Gof the area from the given axis'.

Proof:

Considerastripofcircle, whose moment of inertiais required about a line AB as shown in figure. Line AB is parallel to the axis passing through the C.G of the circle.

Let, \(\delta a = \text{ area of the small strip} \)
y=distance of strip from the centre of gravity \(b = \text{ distance between centre of gravity of the section} \)

andthe axis AB

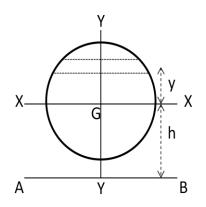

Momento finertia of the whole section about the axis X-

Xpassing through the C.G of the section $(I_G)=\sum \delta a.y^2$ Moment of inertia of the section about the axis AB

$$I_{AB} = \sum \delta a.(h+y)^{2} = \sum \delta a(h^{2}+y^{2}+2hy)$$

$$= \sum h^{2}\delta a + \sum y^{2}\delta a + \sum 2hy.\delta a$$

$$= ah^{2} + I \qquad _{G} + 0 = I \qquad _{G} + ah^{2}$$

M.Iof rectangular section:

ConsiderarectangularsectionABCDofwidth'b'and depth 'd' as shown in figure.

SIMPLELIFTINGMACHINE

LiftingMachine:

Amachinewhichisusedtoliftheavyloadscomparativelybyusingsmallereffortisknownaslifting machine.

Simpleliftingmachines:

Itisadevicewhichisabletoovercomeresistanceandproduceusefulworkintermsofliftingor lowering load when effort is given to it.

Compoundlifting machine:

Itisadevicewhichisconsistsofanumberofsimplemachineswhichisabletoliftorlowerload at a faster speed and lesser effort.

ConceptofasimpleliftingMachine:

Considerasimplepulleywhichisusedtoraise a load (W) by effort (P). When the effort P is applied at the end of rope the effort moves by distance 'y', while the load moves up by a distance 'x'.

Input of a Machine:

Itistheworkdoneonthemachinetoliftload. It is the product of effort (P) applied to lift the load and distance moved by the effort (y).

Output of a Machine:

It is the work done by the machine. It is the productofweight(W)liftedandthedistance moved by the effort (x).

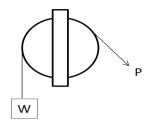

Efficiencyofthemachine:

Itistheratioofoutputworktoinputworkof the machine.

i.e. efficiency=
$$\frac{output}{input}$$

Weknow that,

Asimple pulleyusedto lift loadWbyan effort P.

Mechanicaladvantage(M.A):

Itistheratioofweightliftedbytheeffortapplied to lift the load.

i.e.
$$M.A = \frac{W}{P}$$

Velocityratio(V.R):

Itistheratioofdistancemovedbytheeffort(y) to the distance moved by the load (x).

i.e. V.R =
$$\frac{y}{x}$$

${\bf Expression for efficiency of \ simple lifting machine:}$

Consideraliftingmachine whichlifts weightW byasmallereffort P.

Let y= distance moved by effort x=distance moved by effort

 $M.A = \frac{W}{P}$ and $V.R = \frac{y}{x}$

Inputofthemachine= $P \times y$ Outputofthe machine= $W \times x$

We know that efficiency of the machine $(\eta) = \frac{output}{input} = \frac{W.x}{P.y} = \frac{W}{Y} = \frac{MA}{VR}$

This is therequired expression for efficiency of the machine.

Condition of self locking:

Amachineiscalled asselflocking, if it is unable to dowork in reverse direction after the removal of load from

For actual machine, friction loss in machine = input-output = $(P \times y) - (W \times x)$

Foraselflockingmachineoutput ofthemachineis lessthan orequal tothefrictional loss.

WheneffortPiszero,wecanwrite: $W \times x \le (P \times y) - (W \times x)$

$$\Rightarrow 2 \times (W \times x) \le (P \times y)$$

$$\Rightarrow \frac{W \times x}{P \times y} = \frac{1}{2}$$

$$\Rightarrow \frac{MA}{VR} \le \frac{1}{2}$$

$$\Rightarrow \eta \le \frac{1}{2} \text{ or } 50\%$$

Thusforaselflockingmachine efficiency is less than or equal to 50%.

Condition of reversibility:

Amachineiscalled asreversible, if it is able to do work in reverse direction after the removal of load from it.

For a actual machine, friction loss in machine = input – output = $(P \times y)$ – $(W \times x)$ For a

reversible machine output of the machine is more than frictional loss.

WheneffortP iszero, we canwrite:

$$W \times x > (P \times y) - (W \times x)$$

$$\Rightarrow 2 \times (W \times x) > (P \times y)$$

$$\Rightarrow \frac{W \times x}{P \times y} \frac{1}{2}$$

$$\Rightarrow \frac{MA}{VR} > \frac{1}{2}$$

$$\Rightarrow \eta > 1 \text{ or } 50\%$$

Thusforareversible machineefficiencyisgreater than 50%. *:*.

Lawof Machine:

Thelawofmachinegivestherelationbetweentheload to be lifted and effort required.

Ifamachineliftloadscorrespondingtoappliedefforts, then a relation is obtained which can be shown graphically as shown in figure.

The straight line AB shown in figure represents the law of machine.

i.e.
$$P = mW + C$$

Maximum M.A =
$$\frac{1}{m}$$

Maximum M.A =
$$\frac{1}{m}$$
Maximum Efficiency = $\frac{1}{m \times V.R}$

Ρ 1 В W

P=effortappliedtolifttheload W = load lifted

Effectoffrictioninsimpleliftingmachines:

In actualmachinesthereisfrictionattheeffortsideorloadside. Duetothis extraworkisneeded to lift the loads by overcoming this friction.

If friction is present in the effort side, then the friction can be said as the extra effort required overcomingthefrictionalforce. Iffrictionispresentinloadside, then the friction can be said as the extra load which is to be lifted.

Mathematically:
$$F_{effort} = P^{-W} \frac{1}{V.R}$$
 and $F_{load} = (P \times V.R) - W$

Someexpressioncanbe considered:

PROBLEMS

In acertainweightliftingmachineaweightof1kNisliftedbyan effortof25N.Whilethe weight moves by 100 mm, the point of application of effort moves by 8 m. Find the M.A, V.R and efficiencyof themachine.

Ans: Data Given:

Weight (W) =1 kN =1000 N effort(P) =25N displacement of weight (x)=0.1 m displacement of effort (y)=8 m

Machanical advantage (MAA) =
$$\frac{W}{V}$$
 1000 ...

Mechanicaladvantage(M.A)=
$$\frac{W}{P} = \frac{1000}{25} = 40$$

Velocityratio(V.R) =
$$\frac{y}{x} = \frac{8}{\pm 80}$$

Efficiencyofthemachine(η)= $\frac{M.A}{VR} = \frac{40}{80}$ (ANS)

What load can be lifted by an effort of 120 N, if the velocity ratio is 18 and efficiency of the machineatthisloadis60%? Determinethelawofthemachine, if it is observed that an effort of 200 N is required to lift aload of 2600 N and find the effort required to run the machine at a load of 3.5 kN.

Ans: Data Given:

Effort (P) = 120 N velocity ratio (V.R) = 18 efficiency(
$$\eta$$
)=60%=0.6

Load lifted by the machine:

Mechanicaladvantage(M.A)=V.R
$$\times \eta$$
=18 \times 0.6 =10.8

Load lifted bythe machine(W) =M.A
$$\times$$
P =10.8 \times 120 =1296 N (ANS)

Lawof machine:

Case-1: effort(P)=
$$120N$$
,load(W)= $1296N$

Case-2: effort(P)=
$$200N$$
, load (W)= $2600 N$

Case-3:
$$load(W) = 3.5 kN = 3500 N$$
, effortrequired (P) =?

Forcase-1: lawofmachineis
$$120=m \times 1296 + C....(1)$$

Forcase-2: lawofmachineis
$$200=m \times 2600 + C$$
....(2)

Subtracting equation-2 from 1 we get:
$$(200-120)=m\times(2600-1296)$$

$$\Rightarrow 80 = 1304 \text{ m} \Rightarrow m = \frac{80}{1304} = 0.06$$

Substituting the value of 'm' inequation-2 we can obtain the value for 'C'.

$$C = 44$$

Lawofmachine isgivenby:P =0.06 W +44

Forcase-3: effortrequired(P) = $0.06 \times 3500 + 44 = 254 \text{ N}$ (ANS)

PRACTICEQUESTIONS

In aliftingmachinean effortof31Nraisedaloadof1kN.Iftheefficiencyofthemachineis 0.75, what is its V.R? If on this machine an effort of 61 N raised a load of 2 kN, what is now the efficiency? What will be the effort required to raise the load of 5 kN?

In acertainliftingmachine, the velocity ratio is 15 and its efficiency is 70%. Find out the load to be lifted when an effort of 60 N is applied.

Forasimpleliftingmachine, the velocity ratio is 60. An effort equal to 120 Nisrequired to lift the load of 5 kN. Find whether the machine is reversible or not.

In asimpleliftingmachine,aneffortof60Nlifts aloadof740N. The velocity ratio of the machine is 20. Determine the efficiency and friction in terms of effort and load.

In a simple lifting machine, it is seen that 30 percent of the effort applied to lift load is lost in friction. Determine the load that can be lifted through a height of 0.9 m, if an effort of 270 N is applied through 15 m. Also find out the mechanical advantage and efficiency of the machine.

In asimpleliftingmachine, an effortof80Nlifts aloadof1200N. If the velocity ratio of the machine is 18, find out efficiency of the machine and friction in terms of effort and load.

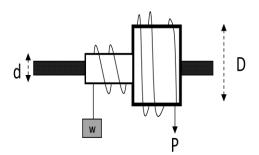

VarioustypesofSimpleLifting Machines:

Simplewheelandaxle:

Itisasimpleliftingmachinewhichisconsistof a wheel of diameter 'D' and an axle of diameter'd' fitted on the shaft. The shaft is providedbyballbearingstominimizefrictional resistance.

One rope or string is mounted over the axle, at theendofwhichloadisattached. Anotherstring is mounted over the wheel at the end of which effort is applied. This mechanism is shown in figure.

When the effort is applied the wheel and axle rotates in same direction. The string is attached insuchamannerthatwhenropeofthewheelun woundstheropeoftheaxlewoundsandtheload rises up. When the effort is removed the rope on the wheel wounds and the rope on the axle un wounds, which gives the reversemotion of load.

 $\begin{aligned} & Displacement of effort in one rotation = \pi D \\ & Displacement \ of \ load \ in \ one \ rotation = \pi d \end{aligned}$

Velocity ratio =
$$\frac{\pi D}{\pi d} \frac{D}{d}$$
MechanicalAdvantage= $\frac{W}{P}$

Efficiency=
$$\frac{MA}{VR}$$

SinglePurchaseCrab Winch:

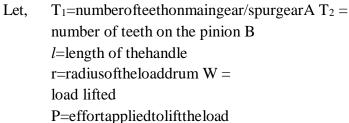

Asinglepurchasecrabwinchisasimplelifting machine which is consists of a load drum, two toothed wheels, rope and a handle. The arrangement of this machine for lifting load is shown in figure.

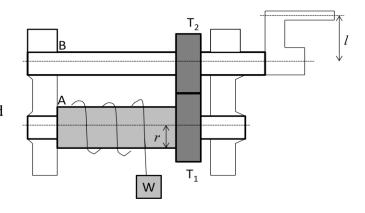

Inthismachinearopeisfixedtothedrumand wound around it. The free end of the rope carries a load 'W'. A toothed wheel A is mountedontheloaddrumandanothertoothed wheel B (pinion) is geared with the toothed wheel A.

Whenthehandleisrotated, the too the dwheel fitted to it rotates, which rotates the pinion.

According to the arrangement when effort is

According to the arrangement when effort is given at the end of the handle the load is moved by the machine.

Singlepurchasecrab winch

Distance movedbytheeffortinonerevolutionofthehandle= $2\pi l$ Number of revolutions made by the pinion B = 1

Number of revolution made by the wheel A = $\frac{T_2}{T_1}$

Number of revolution made by the load drum = $\frac{T_2}{T_1}$

Distancemoved by the load = $2\pi l \times \frac{T_2}{T_1}$

: Mechanical Advantage(M.A)=
$$\frac{W}{P}$$
 and efficiency= $\frac{M.A}{V.R}$

Screw jack:

A screw jack is a simple lifting machine which lifts or lowers heavy loadswithasmallereffort. Inascrewjackeffortisappliedattheend of a lever/handle or by using a pulley to lift heavy loads given on its load drum. A rotating screw passes through the jack and attached with collar to move axially, as a result it is able to lift the loads in vertically up or downward direction.

Let P_1 =effortappliedattheendoflever W = load to be lifted by screw jack l=lengthofthelever p=pitch of thescrew d=meandiameterofscrew α = helix angle μ =coefficient offriction =tan ϕ

Fromfigure-2weobtained: $\tan \alpha = \frac{p}{\pi d}$ Effortrequiredtoraisetheload(P)= $W \times \tan(\alpha + \phi)$ Effortrequiredtolowertheload(P)= $W \times \tan(\alpha - \phi)$ Torquerequiredtoraisetheload= $W \times \tan(\alpha + \phi) \times d$

$$\Rightarrow P \times l = P \times d$$

 $MechanicalAdvantage = \frac{loadlifted(W)}{effortapplied(P)}$

Velocityratio= $\frac{distance moved by the effort_2\pi l}{distance moved by the load}$ p

Efficiencyof screw jack=

$$\frac{MA}{VR} = \frac{load}{effort} \times \frac{p}{2\pi l} = \frac{W \times p \times 2l}{W \times \tan(\alpha + \phi) \times 2\pi d} = \frac{p}{\pi d \times \tan(\alpha + \phi)} = \frac{\tan\alpha \tan\alpha}{(\alpha + \phi)}$$

Figure-2

Worm& Worm wheel:

Awormisathreadedshaftandwormwheelisa spur gear. The teeth of spur gear engage within the threads of the worm.

Infigurethewormandwormwheelarrangement isshown.Aloaddrumofdiameter'd'ismounted on the shaft on which worm wheel is fixed. The worm is fixed with wheel A over which aropeis wound to apply effort. Effort applied at thewheel A lifts the load W which is carried by a string at its free end. Other end of the string is wound on the drum. One rotation of the worm rotatesthewormwheel throughonetooth.

WormandWormwheel

Let D =diameter of the effort wheel

W=load lifted

T=number of teeth on the worm wheel

r=radius of theload drum P=effortappliedtolifttheload

Distancemoved by the effort in one revolution of the wheel = πD

If the worm is single threaded the load drumwill move through

_revolution

Distancethroughwhich loadwillmove =

Velocityratio(V.R) = $\frac{dis \text{ tancemoved by the effort}}{dis \text{ tance moved by the load}} - \frac{\pi D}{2\pi r} = \frac{DT}{2r}$

MechanicalAdvantage(M.A)= $\frac{W}{P}$ and Efficiency(η)= $\frac{MA}{VR}$

Ifthewormisdouble threaded:

$$V.R = \frac{DT}{2 \times 2r} = \frac{DT}{4r}$$

PRACTICEQUESTIONS

Asimplewheelandaxlehaswheelandaxleofdiameters300mmand30mmrespectively. Whatisthe efficiency of the machine if it can lift a load of 900 N by an effort of 100 N?

In a wheel and axle machine the diameter of the wheel is 100 cm and that of axle is 10 cm. The rope thicknessonthewheel is3mmandthat onthedrumis6mm. Inthismachinealoadof 500Nislifted by an effort of 100 N. Determine the efficiency of the machine and state whether the machine is reversible or not.

Inasinglepurchasecrabwinchthe number ofteeth onpinion is 25 and that onthespur wheel 100.Radiiofthedrumandthehandleare50mm and300mmrespectively. Findtheefficiency of the machine.

In a single purchase crab winch, the number of teeth on pinion is 25 and on the spur wheel is 250, radius of drumand handle are 1500 mm and 300 mm respectively. Find the efficiency of the machine and the effect of friction, if an effort of 20 N can lift a load of 300 N.

A worm and worm wheel with 40 teeth on the worm wheel has effort wheel of 300 mm diameterandloaddrumof100mmdiameter. Find the efficiency of the machine, if it can lift a load of 1800 N with an effort of 24 N.

<u>DYNAMICS</u>

Dynamics	#	It is the branch of science which deals with characteristics of bodies or particles in motion. It is classified as <i>Kinematics</i> and <i>Kinetics</i> .
Kinematics	#	It is the study of motion of a particle or body without considering theforces causing the motion of it.
Kinetics	#	Itisthestudyofmotionofthebodyorparticlebyconsideringthe forces causing the motion of it.
Motion	#	A body is said to be in <i>motion</i> if it is changing its position with respect to its surrounding. Abody is a trest when it does not change its position with respect to its surrounding.
Rectilinear motion	#	Whenabodymovesalongstraightline,itsmotioniscalledas rectilinear motion.
Curvilinear motion	#	Whenabodymovesalongacurvedline,itsmotionisknownascurvilinear motion.
Rotaryorcircular motion	#	Whenabodymovesalongacircularpath,itsmotioniscalledas circular or rotary motion.
Speed	#	Itistherateatwhichamovingparticle/bodycoversitspath.Itisa scalar quantity. It is denoted by 'v'. The S.I unit of speed is (m/s).
		Averagespeedistheratiooftotaldistancetravelledandtotaltime taken.
Displacement	#	The distance travelled by a particle/body along a straight line. It is a vector quantity. It is denoted by 's'. The S. I unit of displacement is (m).
Velocity	#	It is the rate of change of displacement of the particle. It is a vector quantity. It is given bythe ratio of displacement and time. It is denoted by 'v'. The S.I unit of velocity is (m/s).
Acceleration	#	It is the rate of change of velocity. It is a vector quantity. It is given by the ratio of velocity and time. It is denoted by 'a'. The S.I unit of acceleration is (m/s^2) .
		Acceleration is taken as the rate of increase of velocity of the moving particle.
		Retardation is therate of decrease of velocity of the moving particle.
Uniformvelocity& Variable velocity	#	When a particle passes through equal displacements in equal intervals of time, the velocity is called as <i>uniform velocity</i> . When a particle does not pass through equal displacements in equal intervals of time, the velocity is called as <i>variable velocity</i> .
Uniform&Variable acceleration	#	If the acceleration of the moving particle remains constant, it is called as <i>uniformacceleration</i> . If the acceleration of the moving particle does not remain constant, it is called a <i>non-uniformorvariable acceleration</i> .

LawsofMotion:

* Newton's first law of motion:

Itstatesthat, "Everybodycontinuousinitsstateofrestorofuniformmotioninastraightline when there is no force acting on the body to change its state of rest or uniform motion". Thislaw is also knownas law of inertia.

♣ Newton'ssecondlawofmotion:

It states that, "the rate of change of momentum is directly proportional to the external force andtakesplaceinthesamedirectionofforce". This law gives us the fundamental equation of

Considerabodymoving in astraightline whosevelocitychanges duringthistime.

Let,m = mass of the body

u=initialvelocityofthebody

= final velocity of the body

a=accelerationduetogravity t

= time required to change the velocity from 'u' to 'v'

F=forcerequiredtochangevelocityfrom'u'to'v'intime't'second Initial

momentum = m.u

Finalmomentum=m.v

Rate of change of momentum = $\frac{mv - mu}{t} = \frac{m(v - u)}{t}$

We know that, v = u + at

$$\Rightarrow a = \frac{v - u}{t}$$

Rate of change of momentum = m.a ∴.

According to 2nd law, rate of change of momentum is directly proportional to external force.

∴. Rateofchangeof momentum=externalforce=m.a

Newton'sthirdlawof motion:

Itstatesthat, "for everyactionthereisequalandoppositereaction".

D-Alembert'sprinciple:

Itstatesthat, "thesystem offorcesactingonabodyinmotionisindynamicequilibriumwith the inertia force of the body".

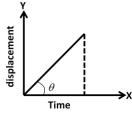

From Newton's second law, $F=m.a \Rightarrow F-ma=0$.

This equation is known as equation of dynamic equilibrium.

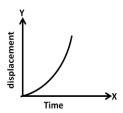

Inthis equation, F=external force applied on the body

(m.a)=imaginaryforceappliedoppositetothedirectionofFormotion of the body (*Inertia force*)

Displacement-timegraph:

(Whenthevelocityisvariable)

Velocity-timegraph:

(whenthevelocityisuniform)

(whenthevelocityisvariable)

Motion of aparticleacteduponbyaconstant force:

Consideraparticlein linearmotion, whichismoving with uniform acceleration 'a'.

u =initial velocity of the body Let,

v = final velocity of the body

t = time taken to change velocity

S=distancetravelledbytheparticleduringtime't' a =

uniform acceleration

Acceleration(a)=
$$\frac{final\ velocity\ -initial\ velocity}{timetaken for the change of velocity} = \frac{v-u}{t}$$

$$\Rightarrow$$
at = (v -u) \Rightarrow v= u+ at -----(1)

Distancetravelledbytheparticleduringthistime(S)= $V_{average} \times time$

$$\Rightarrow S = \frac{u+v}{2} \times t \qquad \Rightarrow S = \frac{u+u+at}{2} \times t = \frac{2ut+at^2}{2} \qquad \Rightarrow S = u.t + \frac{1}{a}t^2 \qquad - \dots (2)$$

$$\Rightarrow S = u.t + \frac{1}{2}at^2 \qquad - \dots (2)$$

Distance travelled by the particle during this time (S) = $V_{average} \times time$

Distancetravelled innth second:

Let, S_n=distancetravelled by the body in 'n' second

S_{n-1}=distancetravelledbythe bodyin (n-1) second

S =distancetravelled by the body in nth second= S_n - S_{n-1}

$$S=u.n+1a.n^2$$

and
$$S_{n-1} = u.(n-1) + \frac{1}{2}a.(n-1)$$

Motionunderforceof gravity:

If the bodyfalls duegravity then the equations of motion can be written as follows:

$$v=u+gt$$
 -----(1)

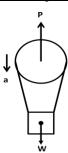

$$S=ut + \frac{1}{2}gt^2 \qquad -----(3)$$

PROBLEM

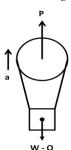

Que-1) AballoonofgrossweightW fallsverticallydownwardwithconstantacceleration a. What amount of ballast Q must be thrown out in order to give the balloon an equal upward acceleration a. Neglect air resistance.

Ans:

Case-1: when balloon is falling

Case-1:whenballoonis rising

The equation of motion for this case is The equation of motion for this case is

$$\underline{\underline{W}}_{o} = W - P - \dots (1)$$

$$\frac{W}{a} = W - P - \dots (1) \qquad \frac{W}{a} = P - (W - Q) - \dots (2)$$

On solving equation 1 and 2 we get: $Q = \frac{2Wa}{g+a}$

$$Q = \frac{2Wa}{g+a} \tag{Ans}$$

Que-2)On turning a corner a motorist rushing at 20 m/s, finds a child on the road 50 mahead. He instantlystopstheengineandappliesbrakes, soastostopthecarwithin 10 mofthechild. Calculate (i) retardation(ii) time required to stop the car.

Ans: Datagiven:

Initial velocity(u)=20m/s, final velocity(v)=0,

distance travelled by the car (s) = 50 - 10 = 40 m

Weknowthat:

$$v^2 = u^2 + 2as$$

$$v^2 = u^2 + 2as$$
 \Rightarrow 0=20²+2×a×40=400+80a

$$\Rightarrow retardation(a) = -\frac{400}{\cancel{=}-5}m/s^2$$

Weknowthat:

$$v=u +at$$
 $\Rightarrow 0=20+(-5)\times t$

$$\Rightarrow timetaken(t) = \begin{array}{c} 20 \\ = 4 \text{sec} \\ 5 \end{array}$$

:. Thusretardationis-5m/s²andtimetakenis4sec.(Ans)

Que-3) Amotorcartakes10secondstocover30metresand12secondstocover42metres.Find the uniform acceleration of the car and its velocity at the end of 15 seconds.

Ans: Data given:

Case-1:Whentime(t)=10sec, distance covered(s)=30m

Case-2:Whentime(t)=12sec, distance covered(s)=42m

Let,u=initial velocity of the carand a=uniform acceleration

Distancetravelledby the carin $10\sec = 30 = ut + \frac{1}{at^2} = u \times \underline{10} + \frac{1}{a} \times a \times 10^2$

$$\Rightarrow$$
30=10*u*+50*a* -----(1)

Distance travelled by the car in 12 sec= $42=ut+\frac{1}{2}at^2=u\times12+\frac{1}{2}\times a\times12\frac{2}{2}$

$$\Rightarrow$$
42 =12*u*+72*a* -----(2)

Solvingthe two equations by elimination method we get:

$$5 \times 42 = 5 \times (12u + 72a)$$
 $\Rightarrow 210 = 60u + 360a$ -----(3

$$6 \times 30 = 6 \times (10u + 50a)$$
 $\Rightarrow 180 = 60u + 300a$ ------(4)

Subtracting equation 4 from 3 we get:
$$30=60a$$
 $\Rightarrow a = \frac{30}{=}0.5 m/s^2$ (Ans)

Substituting the value of 'a' in equation-4 we get:

$$180=60u+300\times0.5$$
 $\Rightarrow 60u=180-150=30$ $\Rightarrow u=\frac{30}{60}.5m/s^2$

Velocity of the car after time 15
$$\sec(v) = u + at = 0.5 + 0.5 \times 15 = 8 \text{ m/s}$$
 (Ans)

Que-4) Abodyisreleasedfromagreatheightfallsfreelytowardsearth. Anotherbodyisreleased from the same height exactly one second later. Find the separation between both the bodies, after two seconds of the release of second body.

Datagiven: Ans:

Initialvelocities of both the bodies (u)=0 Time

taken by the first body $(t_1) = 3 \text{ sec}$

Time taken by the second body $(t_2)=3-1=2$ sec

Distance covered by the first body after
$$3 \sec = (S_1) = ut + \frac{1}{g}t^2$$

$$= 0 + \frac{1}{2} \times 9.8 \times 3^2 = 44.1m \quad - \dots \quad (i)$$

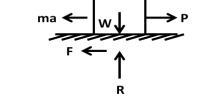

$$\therefore$$
 Separation between bodies = S_1 - S_2 =44.1–19.6 = 24.5 m (Ans)

Que-5) Abodyofmass5kgstartsfromrestandattainsaspeedof4m/sinahorizontaldistanceof 12 m. Assume coefficient of friction is 0.25. Find out the minimum force P acting on the body. consider thefreebodydiagram of the body. Ans:

Initial velocity of the body=u= o

We know that;
$$v^2 = u^2 + 2as \implies a = \frac{v^2 - u^2}{2s}$$

$$\Rightarrow a = \frac{4^2 - 0}{2 \times 12} = 16/24 = 0.6667 \, m/s^2$$

ReactionR = $W = m.g = 5 \times 9.81 = 49.05 \text{ N}$

FrictionalforceF= $\mu R=0.25\times49.05=12.2625N$

Inertiaforce=m.a=5× 0.6667=3.3334 N

Takingthesum of allhorizontal forcesequalto zero, we get;

$$P - F - ma = 0$$
 $\Rightarrow P = F + ma = 12.2625 + 3.3334 = 15.5955 N$ (Ans)

Que-6) Astoneisdroppedfromthetopofthetowerof50mhigh. At the same time another stone is thrown upwards from the foot of the tower with a velocity of 25m/s. When and where the two stones cross each other?

Ans: Datagiven:

Heightof thetower (h)= 50m,

Considerthemotionoffirst stone:

Let,t=timetakenforthestonestocrosseachother, initial

velocity (u) = 0

Distancetravelledbythestone(s)=
$$ut+\frac{1}{2}gt^2=0+\frac{1}{2}gt^2=0.5gt^2$$
 ----- (1)

Considerthemotion of second stone:

initial velocity=-25 m/s, distance travelled = 50 - s

initial velocity=-25 m/s, distance travelled = 50 – s

Distance travelled by the stone = 50 – s =
$$ut + \frac{1}{g}t^2 = -25t + 0.5gt^2$$

Adding equation 1 and 2 we get: $50=25$ t $\Rightarrow t = \frac{50}{25} = 2\sec$ (Ans)

Addingequation 1 and 2we get:
$$50=25 \text{ t}$$
 $\Rightarrow t = \frac{50}{25} = 2 \sec$ (Ans)

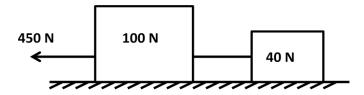

Point where the stones cross each other:

Substitutingthevalueoft=2sec, weget; s

$$=0.5gt^2=0.5\times9.8\times2^2=19.6 m \tag{Ans}$$

ASSIGNMENT

- Que-1) Ablockweighing2500Nrestsonahorizontalplanefor which coefficientoffriction is 0.20. This block is pulled by a force of 1000 N, which is acting at an angle of 30^{0} to the horizontal. Findthevelocity of block after it moves 30 mstarting from rest. (Ans: 7.914m/s)
- Que-2) Two bodies of mass 100 kg and 40 kg are connected by a thread and move along a horizontal plane under the action of a force 450 N applied to the first body of mass 100 kg as shown in figure. The coefficient of friction between the sliding surfaces ofbodies and the plane is 0.3. Determine the acceleration of the two bodies and the tension in the thread $(Ans:0.271 \text{m/s}^2, 128.57 \text{N})$ using D-Alembert's principle.

- A man weighing 800 N stands on the floor of a lift. Find the pressure exerted on the floor Que-3) when (i) the lift moves upwards with an acceleration of 3 m/s² and (ii) the lift moves downwards with an acceleration of 3 m/s². (*Ans*:979.35N,520.64N)
- A gun of mass 30 kg fires a bullet of mass 25 grams with a velocity of 230 m/s. Find the Oue-4) velocity with which the gun recoils. (Ans:0.19m/s)
- A bullet of mass 10 gram is fired horizontally with a velocity of 1000 m/s from a gun of Que-5) mass 50 kg. Find (i) velocity with which the gun will recoil and (ii) force necessary to bring the gun to rest in 250 mm. (Ans:0.2m/s,4N)

Que-6) Twoblocksweigh50Nand25Nareconnectedatthetwoendsofastringpassingovera smooth pulley. The block weighing 50 N is placed on a smooth horizontal surface while the block weighing 25 N is hanging free in air. Find (i) acceleration of the system and (ii)tension in the string.

(Ans: a = 3.27 m/s², T = 16.667 N)

Work:

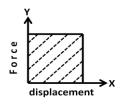

Ifabodyissubjectedtoforce'F'anddisplacedbydistance'S'duetotheactionofforce,thenitis said that some work is done on the body. It is given by the product of force and displacement.

Mathematically:

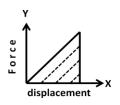

Workdone=
$$F \times S$$

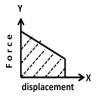

$$(1 \text{ Joule} = 1 \text{ N-m})$$

Forcedisplacementdiagram: (graphical representation of work)

displacement

Whentheforceis uniform

Whentheforcevaries uniformlyfromsmall value to maximum

Whentheforcevaries uniformly from zero to maximum

Whentheforcevaries uniformly from maximum to some value

Whentheforcevaries uniformly from maximum to zero

Power:

Itistherateof doingwork. Itis measured by the work done per second. Its unitis Joule/secor Watt.

Mathematically:

Power=\frac{workdone}{time}

IndicatedPower:

Itisthe actualpower developedbytheengine. Itis measured bythein dicator diagram.

IndicatedhorsepoweristhemeasureofindicatedpowerinM.K.Sunitsorintermsofhorsepower. Indicated power is given in Watt. $1~H.P=75~kg-m/s \qquad 1~kW=1000~kJ/s$

Brake Power:

Itistheactualpoweravailableattheengineshaft.

Itismeasuredbyapplyingfrictionalbraketotheshaft.So,itisknownasbrakepower.Itisalways less than the indicated power.

FrictionalPowerLoss:

Itisthepowerlostinan engineduetofriction. Itisgivenbythedifferencebetweenindicatedpower and brake power.

Energy:

Itisthecapacityof doingwork. Itsunitis Joule.

1joule=1 N-m/s

PotentialEnergy:

Itis thecapacitytodo work duetotheposition of thebody.

Considerabodyofmass 'm'ataheight'h'abovethegroundlevel. Whenitiscomingdownit possesses some energy which is called as potential energy.

Workdone=force×distance =weight× height= mg×h

:.Potentialenergy=m.g.h

KineticEnergy:

Itis thecapacitytodo work duetothemotion of the body.

Considerabodyofmass 'm'movingthroughadistance's' withavelocity'u'andcomingtorest. As the body is coming into rest, its final velocity v = 0.

We know that;
$$v^2 - u^2 = 2as \implies 0 - u^2 = 2as \implies a = \frac{-u^2}{2s} \implies a = \frac{u^2}{2s}$$
 (retardation)
Work done due to motion = $force \times distance = F \times s = m \times a \times s = m \times l$ $\left(\begin{array}{c} u^2 \\ 2s \end{array} \right) \times s = -mu$

Kineticenergy=
$$\frac{1}{2}mu^2$$

If the body is moving with a velocity of `v', then Kinetic energy =

$$\frac{1}{2}mv^2$$

Lawofconservation of energy:

Itstatesthat, "theenergycanneitherbecreatednordestroyed, but it can be transformed from one form to another". Thus total energy possessed by the body always remains constant.

Proof:

Considerabodyofmass'm'ataheight'h'abovethe ground level at position A as shown in figure.

Consider threepositions of thebodyA, B and C.

At positionA:

Thekineticenergyiszerobecausethebodyisatrest.

Potential energy = m.g.h

Totalenergy=KE + PE = 0 + m.g.h = m.g.h

At position B:

Letthebodyfallsfreelytoadistance'x'fromAwith velocity 'v' to a new position B.

AtBpotentialenergyisconvertedintokineticenergy. We

know that,
$$v^2 = u^2 + 2gx = 0 + 2gx = 2gh$$

 $\Rightarrow v = \sqrt{2gx}$

Totalenergy=KE+PE=
$$\frac{1}{-mv^2+mg(h-x)^2}$$

= $\frac{1}{m}(2\sqrt{2gx})^2+mgh-mgx$ = $\frac{1}{2}m\times 2gx+mgh-mgx=mgh$

 $When the body reaches at point C, its potential energy becomes zero and the body possesses only \ kinetic\ energy.$

At point C, velocity(v)=
$$\sqrt{2gh}$$

Kineticenergyat C =
$$\frac{1}{2}mv^2 = \frac{1}{2}m \times (\sqrt{2gh})^2 = mgh$$

Totalenergyat C = KE + PE = m.g.h + 0 = mgh

From the above we include that, the sum of potential energy and kinetic energy at each level is constant. Therefore total energy in any system is always constant.

Datum Level

PROBLEM

Que-1)*Apumplifts40m³ ofwatertoaheightof50manddeliversitwithavelocityof5m/s.* What istheamountofenergyspentinthisprocess? If the jobis done inhalfanhour, what is the power of the pump which has an overall efficiency of 70%?

Ans: <u>Datagiven</u>:

volumeofwater= 40m^3 ,heightofwaterlifted (h)=50m,velocity(ν)=5 m/s, time taken (t) = $\frac{1}{2}$ hour = 30 min = 1800 s, overall efficiency = 70% = 0.70

Workdoneinliftingwater of 40 m³ to a height of 50 m = weight of water \times height = W \times h = 40 \times 9810 \times 50=19620000Nm

Kineticenergyatdeliveryof water=
$$\frac{1}{2} \times \frac{W}{g} v^2 = 1 \times \frac{40 \times 9810}{2} \times \frac{5^2 = 500000 \text{Nm}}{9.81}$$

Total energyspent=
$$19620000+50000=20120000Nm = 20.12 \times 10^6Nm$$
 (Ans)

Outputpower of the pump = Output energy spent/second =
$$\frac{20120000}{1800} = 11177.8 \text{ watt}$$
= 11.1778kW

Inputpower=
$$\frac{11.1778}{0.7}$$
 = 15.9583kW (Ans)

Que-2) Calculate the time taken by a water pump of power 500 Wto lift 2000 kg of water to a tank, which is at a height of 15m from the ground? Take $g = 10 \text{ m/s}^2$.

Ans: <u>Datagiven</u>:

$$\frac{g}{power(P) = 500 \text{ W,mass ofwater (m)} = 2000 \text{kg,heightoftank(h)} = 15 \text{ m}}$$

$$Power(P) = \frac{mgh}{t} \qquad \text{Timetaken(t)} = \frac{mgh}{P} = \frac{2000 \times 10 \times 15}{500} = 600 \text{s}$$
(Ans)

Que-3) Acarweighing 1000kg and travelling at 30m/sstops at a distance of 50m decelerating uniformly. What is the force exerted on it by the brakes? What is the work done by the brakes?

Ans: *Datagiven*:

massofcar(m)=1000kg,initial velocityofcar(u)=30m/s,distancecovered(s)=50m Since the car stops, final velocity (v) = 0

Workdonebythe brakes=kinetic energyof thecar

$$\Rightarrow W = {1 \over 2} {m\underline{u}^2} = {1 \over 2} \times 1000 \times 30^2 = 450000 \text{J}$$

Work done=
$$F \times S$$
 $\Rightarrow 450000 = F \times 50$ $\Rightarrow F = \frac{450000}{50} = 9000N$

:. Forceexerted by the brakes is 9000 N.

```
\label{eq:local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_
```

Totalmomentumbeforecollision= $m_1u_1+m_2u_2$

Totalmomentumaftercollision= $m_1v_1+m_2v_2$.

Weknow that impulseof aforce is equal to the change in momentum produced by the force.

Let, I_1 = impulseofforce producedbybody2on body1= $-(m_1v_1-m_1u_1)$ I_2 =impulseofforceproducedby body1onbody2= $(m_2v_2-m_2u_2)$

We know that: $I_1 = I_2$ $\Rightarrow -(m_1 v_1 - m_1 u_1) = (m_2 v_2 - m_2 u_2)$ $\Rightarrow m_1 u_1 + m_2 u_2 = m_1 v_1 + m_2 v_2$

From this expression we conclude that; when no external force acts on the body, the total momentum before impact is equal to total momentum after impact.

Collisionof elasticbodies:

When a body in motion collides with another body (may be in rest or in motion) the two bodies compress each other. Then the two bodies displaces from their position to a new position with different velocities. This is the effect of collision.

If the two bodies come back to their original shape due to their elasticity, then it is known as the collision of elastic bodies.

Collisionof twoelasticbodies:

When two bodies in motion collide with each other, the two bodies compress each other. Then the two bodies displaces from their position to a new position with different velocities. But the sum of momentum of both bodies before and after collision remains same.

ConsidertwobodiesAandBofmassesm₁ andm₂movinginastraightlinehavingadirect impact.

 $\label{eq:local_problem} Let, u_1 = initial velocity of body Abefore collision \\ u_2 = initial velocity of body Bbefore collision \\ v_1 = \\ final \ velocity \ of \ body \ A \ after \ collision \\ v_2 = final velocity of body Bafter collision \\ \end{cases}$

According to law of conservation of momentum: $m_1u_1 + m_2u_2 = m_1v_1 + m_2v_2$

Coefficient of restitution:

It is defined as the ratio between the velocity of separation and velocity of approach.

Consider two bodies A and B having a direct impact as shown in figure.

Let, u_1 =initialvelocityofthebodyA v_1 = final velocity of the body A

u₂ and v₂ are the initial and final velocities of body B respectively.

If u₁ is greater than u₂, then direct impact will happen.

 $\underline{Velocityof\ approach} = (u_1 - u_2)$

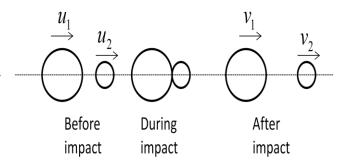

Afterimpact, the v_2 is greater than v_1 .

<u>Velocity of separation</u>= (v_2-v_1)

AccordingtoNewton'slawofcollisionofelastic bodies, "velocity of separation is directly proportional to velocity of approach".

Thuswecanwrite: $(v_2-v_1)=e\times(u_1-u_2)$

Where:e = constant of proportionality knownas coefficient of restitution.

- The value of 'e' lies between 0 and 1.
- ➤ If e=0, twobodies are inelastic.
- ➤ If e=1, tow bodies are perfectly elastic

PROBLEM

*********************************** A ball having mass 4 kg and velocity 8 m/s travels to the east. Impulse given at point

'O'makes it change direction to north with velocity 6 m/s. Find the given impulse and change in momentum.

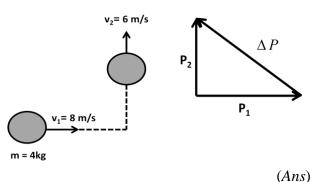

Ans: Datagiven:

P₁ =initialmomentum =m.v₁
=4kg×8m/s=32kg-m/s P₁ =
final momentum = m.v₂
=4kg×6m/s=24kg-m/s From
the triangle;

$$\Delta P^2 = P^2 + P^2 = m_2^2 (v^2 + v^2)$$

=4²(6²+8²)=16×100=1600
 $\Rightarrow \Delta P$ =40kg-m/s
: Impulse=Changeinmomentum=

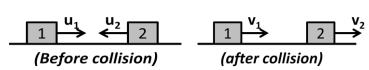

:.Impulse=Changeinmomentum=40kg-m/s

Que-2)Two blocks are travelling towards each other. The first has a speed of 10 cm/s and the second a speed of 60 cm/s. After the collision thesecond is observed to be travelling with speed of 20 cm/s in a direction opposite to its initial velocity. If the weight of the first block is twice that of the second, determine: (i) the velocity of the first block aftercollision, (ii) whether the collision is elastic or inelastic.

Datagiven: Consider the block 1 and 2 and their velocity before and after impact. Ans:

> Letm₁andm₂bethemassof block 1 and 2 respectively.

$$u_1=10 \text{cm/s}, \quad u_2=60 \text{cm/s}, v_2=20 \text{cm/s}, m_1=2 m_2$$

weknow that;
$$m_1 u_1 - m_2 u_2 = m_1 v_1 + m_2 v_2$$
 $\Rightarrow 2m_2 u_1 - m_2 u_2 = 2m_1 v_1 + m_2 v_2$
 $\Rightarrow 2u_1 - u_2 = 2v_1 + v_2$ $\Rightarrow 2 \times 10 - 60 = 2v_1 + 20$
 $\Rightarrow 2v_1 = -60$ $\Rightarrow v_1 = -30 cm/s$ (Ans)

Sumof initial K.E oftwo bodies =
$$\frac{1}{2} \frac{mu^2 + 1}{2} \frac{mu^2 = 1}{2} \times 2m \times 10^2 + \frac{1}{m}$$
=1900 m₂ = $\frac{1}{2} \times 2m \times 10^2 = 1$

Sumof final K.Eof twobodies
$$= \frac{1}{2} m v^2 + \frac{1}{2} m v^2 = \frac{1}{2} \times 2m \times (-30)^2 + \frac{1}{2} m$$

$$= 1100 \text{ m}_2$$

Astheinitial and final kinetic energy is not equal, the collision is in elastic. (Ans)

Que-3)A pile hammer weighing 20 kN drops from a height of 750 mm on a pile of 10 kN. The pile penetrates 100 mm per blow. Assuming that the motion of the pile is resisted by a constant force, find the resistance to penetrate the ground.

Ans: <u>Data given</u>:

initial velocity of hammer (u) = 0, distance moved (h) = 750 mm = 0.75 m, acceleration (a) = 9.81 m/s^2 , weight of pile (W₂) = 10 kN, weight of pile (W₂) = 10 kN, penetrationperblow(s)=100 mm=0.1m Let, R = resistance to penetrate the ground

Let,m₁=massofpilehammer=W₁/g,m₂=massofpile=W₂/g

Velocityat thetime ofstrike (V₁) = $\sqrt{2gh} = \sqrt{2 \times 9.81 \times 0.75} = 3.836 m/s$

Let, V=velocity of the pile and hammer after impact

Applyingprincipleofconservationofmomentum forpileandhammer, we get;

$$mV = (m + m)V$$
 $\Rightarrow \frac{W_1 \times V}{g} = \frac{W_1 + W_2}{g} \times V$ $\Rightarrow \frac{20 \times 3.836 = \frac{20 + 10}{9.81} \times V}{9.81}$
 $\Rightarrow 7.82 = 3.05V$ $\Rightarrow V = 7.82/3.05 = 2.56m/s$

Applyingworkenergyequation tothemotion ofpileandhammer, weget;

$$(W_1 + W_2 - R) \times s = \frac{W_1 + W_2}{2g} \times (u^2 - V^2)$$

$$\Rightarrow (20 + 10 - R) \times 0.1 = \frac{20 + 10}{2} \times (0 - 2.56^2)$$

$$\Rightarrow (30 - R) \times 0.1 = 10.02$$

$$\Rightarrow 30 - R = 10.02 / 0.1 = 100.2$$

$$\Rightarrow R = 100.2 + 30 = 130.2kN$$

∴ Therequiredresistance is130.2kN. (Ans)

ASSIGNMENT

- **Que-1**) Aballof0.5Nweightfallsfromaheightof15mandreboundsto10m.Findtheimpulse and average force between the ball and the floor if the time during which they are in contactis(1/12)of asecond. (*Ans*:1.588 Ns, 19.056 N)
- **Que-2**)A ball of mass 2 kgmovingwith a velocity of 2 m/s hits another ball of mass 4 kg at rest. After the impact, the first ball comes to rest. Calculate the velocity of the second ball after the impact and the coefficient of restitution. (*Ans*:1 m/s, 0.5)
- **Que-3**) Abodyofmass4kgmovingwithavelocityof12m/sovertakesabodyofmass3kg moving with a velocity of 5 m/s in the same direction along a straight line and they coalesce to form one body. Find the velocity with which the single body will move.

(Ans:9 m/s)

Que-4) A mass of 300 kg falls from a height of 3 m on a pile of mass 60 kg and drives it 10 cm into the ground. Calculate: (i) the velocity with which the pile driver hits the pile, (ii) the common velocity with which the pile driver and the pile move together after impact and (iii) the averageresistance of the ground to penetration.

(Ans:7.67 m/s, 6.39 m/s, 77106.6 N)

$$(Hint: V = \sqrt{2gh}, V = \frac{m_1 V_1}{m_1 + m_2}, R = (m_1 + m_2)g\{1 + \frac{m_1^2}{(m_1 + m_2)^2} \times \frac{h_1}{x}\}$$
